### Mental Health

- Evaluation of Mental Health Status 81
- Depression 83
- Stress 86
- Emotional Support 89
- Suicide 90
Mental Health Treatment 91
Key Informant Input: Mental Health 94

**Death, Disease, & Chronic Conditions** 99

**Leading Causes of Death** 100
- Distribution of Deaths by Cause 100
- Age-Adjusted Death Rates for Selected Causes 100

**Cardiovascular Disease** 102
- Age-Adjusted Heart Disease & Stroke Deaths 102
- Prevalence of Heart Disease & Stroke 106
- Key Informant Input: Heart Disease & Stroke 109

**Cancer** 112
- Age-Adjusted Cancer Deaths 112
- Cancer Incidence 115
- Prevalence of Cancer 116
- Cancer Screenings 118
- Key Informant Input: Cancer 123

**Respiratory Disease** 125
- Age-Adjusted Respiratory Disease Deaths 126
- Asthma 129
- Chronic Obstructive Pulmonary Disease (COPD) 131
- Key Informant Input: Respiratory Disease 132

**Injury & Violence** 134
- Leading Causes of Accidental Death 134
- Unintentional Injury 135
- Intentional Injury (Violence) 146
- Key Informant Input: Injury & Violence 153

**Diabetes** 156
- Age-Adjusted Diabetes Deaths 156
- Prevalence of Diabetes 158
- Key Informant Input: Diabetes 161

**Alzheimer’s Disease** 164
- Age-Adjusted Alzheimer’s Disease Deaths 164
- Progressive Confusion/Memory Loss 166
- Key Informant Input: Dementias, Including Alzheimer’s Disease 167

**Kidney Disease** 169
- Age-Adjusted Kidney Disease Deaths 169
- Key Informant Input: Kidney Disease 171

**Potentially Disabling Conditions** 172
- Chronic Pain 172
Arthritis (Douglas County Only) 173
Key Informant Input: Arthritis, Osteoporosis, & Chronic Back Conditions 173
Key Informant Input: Vision & Hearing 174

**Infectious Disease** 176

*Influenza & Pneumonia Vaccination* 177
Flu Vaccination (Douglas County Only) 177
Pneumonia Vaccination (Douglas County Only) 178

**HIV** 179
Age-Adjusted HIV/AIDS Deaths 180
HIV Prevalence 180
HIV Testing 182
Key Informant Input: HIV/AIDS 183

**Sexually Transmitted Diseases** 185
Chlamydia & Gonorrhea 185
Safe Sexual Practices 187
Key Informant Input: Sexually Transmitted Diseases 191

**Immunization & Infectious Diseases** 194
Key Informant Input: Immunization & Infectious Diseases 194

**Births** 195

*Prenatal Care* 196

*Birth Outcomes & Risks* 198
Low-Weight Births 198
Infant Mortality 199
Key Informant Input: Infant & Child Health 201

**Family Planning** 203
Births to Teen Mothers 203
Key Informant Input: Family Planning 204

**Modifiable Health Risks** 206

*Nutrition* 207
Daily Recommendation of Fruits/Vegetables 208
Access to Fresh Produce 210
Sugar-Sweetened Beverages 213

*Physical Activity* 215
Leisure-Time Physical Activity 215
Activity Levels 218
Access to Physical Activity 220
Built Environment 221
Weight Status 227
  Adult Weight Status 227
  Weight Loss Efforts 232
  Key Informant Input: Nutrition, Physical Activity, & Weight 233
Substance Abuse 236
  Age-Adjusted Cirrhosis/Liver Disease Deaths 236
  Alcohol Use 238
  Age-Adjusted Unintentional Drug-Related Deaths 243
  Illicit Drug Use 245
  Alcohol & Drug Treatment 247
  Key Informant Input: Substance Abuse 248
Tobacco Use 251
  Cigarette Smoking 251
  Other Tobacco Use 257
  Key Informant Input: Tobacco Use 259
Access to Health Services 261
  Health Insurance Coverage 262
    Type of Healthcare Coverage 262
    Lack of Health Insurance Coverage 262
  Difficulties Accessing Healthcare 267
    Difficulties Accessing Services 267
    Barriers to Healthcare Access 269
    Key Informant Input: Access to Healthcare Services 273
Primary Care Services 277
  Access to Primary Care 277
  Particular Place for Medical Care 278
  Utilization of Primary Care Services 281
Emergency Room Utilization 283
Tele-Health Visits 285
Oral Health 287
  Dental Care 287
  Key Informant Input: Oral Health 289
Healthcare Information & Resources 291
  Perceptions of Local Healthcare Services 292
Healthcare Information 295
  Healthcare Information Sources 295
  Participation in Health Promotion Events 296

Introduction
Project Overview

Project Goals
This Community Health Needs Assessment, a follow-up to similar studies conducted in 2002 (Douglas County only), 2008 (Douglas, Sarpy, Cass counties only), 2011 and 2015, is a systematic, data-driven approach to determining the health status, behaviors and needs of residents in the Omaha metropolitan area (including Douglas, Sarpy, Cass, and Pottawattamie counties). Subsequently, this information may be used to inform decisions and guide efforts to improve community health and wellness.

A Community Health Needs Assessment provides information so that communities may identify issues of greatest concern and decide to commit resources to those areas, thereby making the greatest possible impact on community health status. This Community Health Needs Assessment will serve as a tool toward reaching three basic goals:

- **To improve residents’ health status, increase their life spans, and elevate their overall quality of life.** A healthy community is not only one where its residents suffer little from physical and mental illness, but also one where its residents enjoy a high quality of life.

- **To reduce the health disparities among residents.** By gathering demographic information along with health status and behavior data, it will be possible to identify population segments that are most at-risk for various diseases and injuries. Intervention plans aimed at targeting these individuals may then be developed to combat some of the socio-economic factors that historically have had a negative impact on residents’ health.

- **To increase accessibility to preventive services for all community residents.** More accessible preventive services will prove beneficial in accomplishing the first goal (improving health status, increasing life spans, and elevating the quality of life), as well as lowering the costs associated with caring for late-stage diseases resulting from a lack of preventive care.

This assessment was sponsored by a coalition comprised of local health systems and health departments. Sponsors include: CHI Health (CHI Health Bergan Mercy, CHI Health Creighton University Medical Center, CHI Health Immanuel, CHI Health Lakeside, CHI Health Mercy Council Bluffs, and CHI Health Midlands); Douglas County Health Department; Methodist Health System (Methodist Hospital, Methodist Jennie Edmundson Hospital, and Methodist Women’s Hospital); Nebraska Medicine (Nebraska Medicine–Nebraska Medical Center and Nebraska Medicine–Bellevue). Supporting organizations include Charles Drew Health Center; Live Well Omaha; Omaha Community Foundation; One World Community Health Centers, Inc.; Pottawattamie County Public Health Department/VNA; Sarpy/Cass County Department of Health and Wellness; and United Way of the Midlands.
This assessment was conducted by Professional Research Consultants, Inc. (PRC). PRC is a nationally recognized healthcare consulting firm with extensive experience conducting Community Health Needs Assessments in hundreds of communities across the United States since 1994.

**Approach**

The process for this assessment follows an approach as outlined in the Community Health Assessment Toolkit developed by the Association for Community Health Improvement™ (ACHI). In the ACHI model (at right), Collaborating organizations worked through the first three steps in this process, and this assessment document and subsequent communication activities will carry the community engagement model through Step 6. Steps 7 through 9 will be undertaken by the partnering hospitals, health departments, and other organizations over the next three years, at which time the process begins again and this assessment will be updated.

**Methodology**

This assessment incorporates data from both quantitative and qualitative sources. Quantitative data input includes primary research (the PRC Community Health Survey) and secondary research (vital statistics and other existing health-related data); these quantitative components allow for trending and comparison to benchmark data at the state and national levels. Qualitative data input includes primary research gathered through an Online Key Informant Survey.

**PRC Community Health Survey**

**Survey Instrument**

The survey instrument used for this study is based largely on the Centers for Disease Control and Prevention (CDC) Behavioral Risk Factor Surveillance System (BRFSS), as well as various other public health surveys and customized questions addressing gaps in indicator data relative to health promotion and disease prevention objectives and other recognized health issues. The final survey instrument was developed by the sponsoring organizations and PRC and is similar to the previous survey used in the region, allowing for data trending.
Community Defined for This Assessment
The study area for the survey effort (referred to as the “Metro Area” in this report) includes Douglas, Sarpy, and Cass counties in Nebraska, as well as Pottawattamie County in Iowa. For this study, Douglas County is further divided into 5 geographical areas (Northeast Omaha, Southeast Omaha, Northwest Omaha, Southwest Omaha, and Western Douglas County). This community definition is illustrated in the following map.

Sample Approach & Design
A precise and carefully executed methodology is critical in asserting the validity of the results gathered in the PRC Community Health Survey. Thus, to ensure the best representation of the population surveyed a mixed-mode methodology was implemented. This included surveys conducted via telephone (landline and cell phone), as well as through online questionnaires.

The sample design used for this effort consisted of a total of 2,527 individuals age 18 and older in the Metro Area. This random sampling of residents reflects 1,527 adults in Douglas County, 500 in Sarpy County, 100 in Cass County, and 400 in Pottawattamie County. The higher sample within Douglas County reflects targets set to achieve 50 surveys per ZIP Code within the county. Once all of the interviews were completed, these were weighted in proportion to the actual population distribution so as to appropriately represent the individual counties and the Metro Area as a whole. All administration of the surveys, data collection, and data analysis was conducted by PRC.
For statistical purposes, the maximum rate of error associated with a sample size of 2,527 respondents is ±2.0% at the 95 percent confidence level.

### Expected Error Ranges for a Sample of 2,527 Respondents at the 95 Percent Level of Confidence

**Note:**
- The "response rate" (the percentage of a population giving a particular response) determines the error rate associated with that response.
- A "95 percent level of confidence" indicates that responses would fall within the expected error range on 95 out of 100 trials.

**Examples:**
- If 10% of the sample of 2,527 respondents answered a certain question with a "yes," it can be asserted that between 8.9% and 11.1% (10% ± 1.1%) of the total population would offer this response.
- If 50% of respondents said "yes," one could be certain with a 95 percent level of confidence that between 48.2% and 51.8% (50% ± 1.8%) of the total population would respond "yes" if asked this question.

### Sample Characteristics

To accurately represent the population studied, PRC strives to minimize bias through application of a proven telephone methodology and random-selection techniques. While this random sampling of the population produces a highly representative sample, it is a common and preferred practice to "weight" the raw data to improve this representativeness even further. This is accomplished by adjusting the results of a random sample to match the geographic distribution and demographic characteristics of the population surveyed (poststratification), so as to eliminate any naturally occurring bias. Specifically, once the raw data are gathered, respondents are examined by key demographic characteristics (namely sex, age, race, ethnicity, and poverty status), and a statistical application package applies weighting variables that produce a sample which more closely matches the population for these characteristics. Thus, while the integrity of each individual’s responses is maintained, one respondent’s responses may contribute to the whole the same weight as, for example, 1.1 respondents. Another respondent, whose demographic characteristics may have been slightly oversampled, may contribute the same weight as 0.9 respondents.

The following chart outlines the characteristics of the Metro Area sample for key demographic variables, compared to actual population characteristics revealed in census data. [Note that the sample consisted solely of area residents age 18 and older; data on children were given by proxy by the person most responsible for that child’s healthcare needs, and these children are not represented demographically in this chart.]
Further note that the poverty descriptions and segmentation used in this report are based on administrative poverty thresholds determined by the US Department of Health & Human Services. These guidelines define poverty status by household income level and number of persons in the household (e.g., the 2017 guidelines place the poverty threshold for a family of four at $24,400 annual household income or lower. In sample segmentation: “very low income” refers to community members living in a household with defined poverty status; “low income” refers to households with incomes just above the poverty level and earning up to twice (100%-199% of) the poverty threshold; and “mid/high income” refers to those households living on incomes which are twice or more (≥200% of) the federal poverty level.

The sample design and the quality control procedures used in the data collection ensure that the sample is representative. Thus, the findings may be generalized to the total population of community members in the defined area with a high degree of confidence.

**Online Key Informant Survey**

To solicit input from key informants, those individuals who have a broad interest in the health of the community, an Online Key Informant Survey also was implemented as part of this process. A list of recommended participants was provided by the sponsoring organizations; this list included names and contact information for physicians, public health representatives, other health professionals, social service providers, and a variety of other community leaders. Potential participants were chosen because of their ability to identify primary concerns of the populations with whom they work, as well as of the community overall.

Key informants were contacted by email, introducing the purpose of the survey and providing a link to take the survey online; reminder emails were sent as needed to increase participation. In all, 163 community stakeholders took part in the Online Key Informant Survey, as outlined below:

Final participation included representatives of the organizations outlined below.

- All Care Health Center
- Alliance for a Better Omaha
- American Lung Association
- American Red Cross
- Bellevue Fire Department
- Building Healthy Futures
- CHI Health
- CHI Health Clinic
- CHI Midlands Hospital
- Child Saving Institute
- Children's Hospital and Medical Center
- Children's Square, USA
- City of Bellevue
- City of Council Bluffs
- City of Gretna
- City of Omaha
- City Sprouts
- College of Saint Mary
- Completely Kids
- Council Bluffs Health Department
- Council Bluffs Senior Center
- Creighton University
- Douglas County Health Department
- Douglas County Youth Center
- Eastern Nebraska Office on Aging
- Family Housing Advisory Services
- FAMILY, Inc.
- Financial Hope Collaborative
- Food Bank for the Heartland
- Girl Scouts Spirit of Nebraska
- Green Hills Area Education Agency
- Heartland Family Service
- Heartland Workforce Solutions
- Hunger Free Heartland
- Latino Center of the Midlands
- Live Well Omaha
- Lutheran Family Services of Nebraska
- Methodist Health System
- Methodist Physicians Clinic-South
- Metro Area Planning Agency
Through this process, input was gathered from several individuals whose organizations work with low-income, minority, or other medically underserved populations.

**Minority/medically underserved populations represented:**
- African-American, at-risk high school youth, Burmese, children, complex medical care patients, diabetics, disabled, elderly, English as a Second Language residents, foster children, Hispanic, homeless, illegal immigrants/refugees, incarcerated, LGBT, limited English proficiency, low education, low income, Medicaid, Medicare, Muslim, Native American, residents of food deserts, rural, special education population, patients with severe and persistent mental illness (SPMI), substance abusers, Sudanese, teen mothers, uninsured/underinsured, veterans

In the online survey, key informants were asked to rate the degree to which various health issues are a problem in their own community. Follow-up questions asked them to describe why they identify problem areas as such and how these might better be addressed. Results of their ratings, as well as their verbatim comments, are included throughout this report as they relate to the various other data presented.
NOTE: These findings represent qualitative rather than quantitative data. The Online Key Informant Survey was designed to gather input regarding participants’ opinions and perceptions of the health needs of the residents in the area. Thus, these findings are not necessarily based on fact.

**Public Health, Vital Statistics & Other Data**

A variety of existing (secondary) data sources was consulted to complement the research quality of this Community Health Needs Assessment. Data for the Metro Area were obtained from the following sources (specific citations are included with the graphs throughout this report):

- Center for Applied Research and Environmental Systems (CARES)
- Centers for Disease Control & Prevention, Office of Infectious Disease, National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention
- Centers for Disease Control & Prevention, Office of Public Health Science Services, Center for Surveillance, Epidemiology and Laboratory Services, Division of Health Informatics and Surveillance (DHIS)
- Centers for Disease Control & Prevention, Office of Public Health Science Services, National Center for Health Statistics
- Community Commons
- Douglas County (Nebraska) Health Department
- ESRI ArcGIS Map Gallery
- National Cancer Institute, State Cancer Profiles
- OpenStreetMap (OSM)
- US Census Bureau, American Community Survey
- US Census Bureau, County Business Patterns
- US Census Bureau, Decennial Census
- US Department of Agriculture, Economic Research Service
- US Department of Health & Human Services
- US Department of Health & Human Services, Health Resources and Services Administration (HRSA)
- US Department of Justice, Federal Bureau of Investigation
- US Department of Labor, Bureau of Labor Statistics

**Benchmark Data**

**Trending**

Similar surveys were administered in the Metro Area in 2002 (Douglas County only), 2008 (Douglas, Sarpy, Cass counties only), 2011, and 2015 by PRC. Trending data, as revealed by comparison to prior survey results, are provided throughout this report whenever available. Historical data for secondary data indicators are also included for the purposes of trending.
Nebraska & Iowa Risk Factor Data
Statewide risk factor data are provided where available as additional benchmarks against which to compare local survey findings; these data represent the most recent BRFSS (Behavioral Risk Factor Surveillance System) Prevalence and Trends Data published online by the Centers for Disease Control and Prevention. State-level vital statistics are also provided for comparison of secondary data indicators.

Nationwide Risk Factor Data
Nationwide risk factor data, which are also provided in comparison charts, are taken from the 2017 PRC National Health Survey; the methodological approach for the national study is similar to that employed in this assessment, and these data may be generalized to the US population with a high degree of confidence. National-level vital statistics are also provided for comparison of secondary data indicators.

Healthy People 2020
Healthy People provides science-based, 10-year national objectives for improving the health of all Americans. For three decades, Healthy People has established benchmarks and monitored progress over time in order to:

- Encourage collaborations across communities and sectors.
- Empower individuals toward making informed health decisions.
- Measure the impact of prevention activities.

Healthy People strives to:

- Identify nationwide health improvement priorities.
- Increase public awareness and understanding of the determinants of health, disease, and disability and the opportunities for progress.
- Provide measurable objectives and goals that are applicable at the national, State, and local levels.
- Engage multiple sectors to take actions to strengthen policies and improve practices that are driven by the best available evidence and knowledge.
- Identify critical research, evaluation, and data collection needs.

Determining Significance
Differences noted in this report represent those determined to be significant. For survey-derived indicators (which are subject to sampling error), statistical significance is determined based on confidence intervals (at the 95 percent confidence level), using question-specific samples and response rates. For the purpose of this report, "significance" of secondary data indicators (which do not carry sampling error, but might be subject to reporting error) is determined by a 15% variation from the comparative measure.
Information Gaps

While this assessment is quite comprehensive, it cannot measure all possible aspects of health in the community, nor can it adequately represent all possible populations of interest. It must be recognized that these information gaps might in some ways limit the ability to assess all of the community’s health needs.

For example, certain population groups — such as the homeless, institutionalized persons, or those who only speak a language other than English or Spanish — are not represented in the survey data. Other population groups — for example, pregnant women, lesbian/gay/bisexual/transgender residents, undocumented residents, and members of certain racial/ethnic or immigrant groups — might not be identifiable or might not be represented in numbers sufficient for independent analyses.

In terms of content, this assessment was designed to provide a comprehensive and broad picture of the health of the overall community. However, there are certainly medical conditions that are not specifically addressed.
Summary of Findings

Significant Health Needs of the Community

The following “Areas of Opportunity” represent the significant health needs of the community, based on the information gathered through this Community Health Needs Assessment and the guidelines set forth in Healthy People 2020. From these data, opportunities for health improvement exist in the area with regard to the following health issues (see also the summary tables presented in the following section).

The Areas of Opportunity were determined after consideration of various criteria, including: standing in comparison with benchmark data (particularly national data); identified trends; the preponderance of significant findings within topic areas; the magnitude of the issue in terms of the number of persons affected; and the potential health impact of a given issue. These also take into account those issues of greatest concern to the community stakeholders (key informants) giving input to this process.

Summary Tables: Comparisons With Benchmark Data

The following tables provide an overview of indicators in the Metro Area, including comparisons among the individual communities, as well as trend data. These data are grouped to correspond with the Focus Areas presented in Healthy People 2020.

Reading the Summary Tables

- In the following charts, Metro Area results are shown in the larger, blue column.
- The yellow columns [to the left of the green county columns] provide comparisons among the five subareas within Douglas County, identifying differences for each as “better than” (☑), “worse than” (☒), or “similar to” (☐) the combined opposing areas.
- The green columns [to the left of the Metro Area column] provide comparisons among the four counties assessed, identifying differences for each as “better than” (☑), “worse than” (☒), or “similar to” (☐) the combined opposing areas.
- The columns to the right of the Metro Area column provide trending, as well as comparisons between local data and any available state and national findings, and Healthy People 2020 targets. Again, symbols indicate whether the Metro Area compares favorably (☑), unfavorably (☒), or comparably (☐) to these external data.

Tip: Indicator labels beginning with a “%” symbol are taken from the PRC Community Health Survey; the remaining indicators are taken from secondary data sources.

Note that blank table cells signify that data are not available or are not reliable for that area and/or for that indicator.

Throughout these tables, a blank or empty cell indicates that data are not available for this indicator or that sample sizes are too small to provide meaningful results.
Summary of Key Informant Perceptions

In the Online Key Informant Survey, community stakeholders were asked to rate the degree to which each of 20 health issues is a problem in their own community, using a scale of “major problem,” “moderate problem,” “minor problem,” or “no problem at all.” The following chart summarizes their responses; these findings also are outlined throughout this report, along with the qualitative input describing reasons for their concerns. (Note that these ratings alone do not establish priorities for this assessment; rather, they are one of several data inputs considered for the prioritization process described earlier.)

Key Informants: Relative Position of Health Topics as Problems in the Community
Community Description
Population Characteristics

Total Population
The four-county Metro Area, the focus of this Community Health Needs Assessment, encompasses 2,075.51 square miles and houses a total population of 834,374 residents, according to latest census estimates.

Population Change 2000-2010
A significant positive or negative shift in total population over time impacts healthcare providers and the utilization of community resources.

Between the 2000 and 2010 US Censuses, the Metro Area population increased by 96,131 persons, or 13.8%.

- A greater proportional increase than seen across both states and the nation overall.
- Note the considerable percentage increase in Sarpy County.
The following map provides an illustration of the shift in total population.
Urban/Rural Population

Urban areas are identified using population density, count, and size thresholds. Urban areas also include territory with a high degree of impervious surface (development). Rural areas are all areas that are not urban.

The Metro Area is predominantly urban, with 92.1% of the population living in areas designated as urban.

- The area is more urban than Nebraska, Iowa, and the US overall.
- While Douglas and Sarpy counties are predominantly urban, Pottawattamie County (in Iowa) is less so, and Cass County is predominantly rural.

Urban and Rural Population (2010)

Sources: US Census Bureau Decennial Census (2010).

Notes: This indicator reports the percentage of population living in urban and rural areas. Urban areas are identified using population density, count, and size thresholds. Urban areas also include territory with a high degree of impervious surface (development). Rural areas are all areas that are not urban.
• Note the following map outlining the urban population in the Metro Area census tracts as of 2010.

**Age**

It is important to understand the age distribution of the population, as different age groups have unique health needs that should be considered separately from others along the age spectrum.

**In the Metro Area, 26.1%** of the population are infants, children, or adolescents (age 0-17); another 62.1% are age 18 to 64, while 11.9% are age 65 and older.

- The percentage of older adults (65+) is lower than the state and US figures.
- Viewed by county, Sarpy County houses the smallest proportion age 65 and older.
Total Population by Age Groups, Percent
(2012-2016)

Median Age
Douglas and Sarpy counties are “younger” than the states and the nation in that the median ages are lower; in contrast, Cass and Pottawattamie counties are older.

Median Age
(2012-2016)
• The following map provides an illustration of the median age in the Metro Area, segmented by census tract.

**Race & Ethnicity**

**Race**

In looking at race independent of ethnicity (Hispanic or Latino origin), 83.1% of Metro Area residents are White and 8.3% are Black.

• This is less White and more Black than the states’ racial distributions.
• Nationally, the US population is more White, less Black, and more “other” race.
• By county, Douglas County is the most racially diverse and Cass County is the least.
Ethnicity

A total of 10.5% of Metro Area residents are Hispanic or Latino.

- Slightly higher than the Nebraska percentage, and much higher than the Iowa percentage.
- Below the nationwide percentage.
- The percentage ranges considerably by county.

Percent Population Hispanic or Latino

(2012-2016)
Between 2000 and 2010, the Hispanic population in the Metro Area increased by 36,596 people, or 92.6%.

- Higher (in terms of percentage growth) than found statewide and especially nationally.
- Proportionally, Hispanic population growth is especially high in Sarpy and Pottawattamie counties.

Net increase of 36,596 Hispanic residents 2000-2010

Linguistic Isolation
A total of 3.4% of the Metro Area population age 5 and older live in a home in which no persons age 14 or older is proficient in English (speaking only English, or speaking English “very well”).

- Higher than found statewide, but lower than found nationally.
- The percentage is favorably low in Sarpy and Cass counties.

Linguistically Isolated Population
(2012-2016)
• Note the following map illustrating linguistic isolation in the Metro Area.
Social Determinants of Health

About Social Determinants

Health starts in our homes, schools, workplaces, neighborhoods, and communities. We know that taking care of ourselves by eating well and staying active, not smoking, getting the recommended immunizations and screening tests, and seeing a doctor when we are sick all influence our health. Our health is also determined in part by access to social and economic opportunities; the resources and supports available in our homes, neighborhoods, and communities; the quality of our schooling; the safety of our workplaces; the cleanliness of our water, food, and air; and the nature of our social interactions and relationships. The conditions in which we live explain in part why some Americans are healthier than others and why Americans more generally are not as healthy as they could be.

- Healthy People 2020 (www.healthypeople.gov)

Poverty

The latest census estimate shows 12.0% of Metro Area population living below the federal poverty level.

In all, 28.2% of Metro Area residents (an estimated 227,607 individuals) live below 200% of the federal poverty level.

- Lower than the proportion reported in Nebraska, similar to the Iowa proportion.
- Lower than that found nationally.

Population in Poverty

(Populations Living Below 100% and Below 200% of the Poverty Level; 2012-2016)

Sources: US Census Bureau American Community Survey 5-year estimates (2012-2016).

Notes: Poverty is considered a key driver of health status. This indicator is relevant because poverty creates barriers to access including health services, healthy food, and other necessities that contribute to poor health status.
Children in Low-Income Households

Additionally, 35.6% of Metro Area children age 0-17 (representing an estimated 79,108 children) live below the 200% poverty threshold.

- Below the proportion found in Nebraska (similar to the Iowa proportion).
- Below the proportion found nationally.

Percent of Children in Low-Income Households
(Children 0-17 Living Below 200% of the Poverty Level, 2012-2016)

Notes: This indicator reports the percentage of children aged 0-17 living in households with income below 200% of the Federal Poverty Level (FPL). This indicator is relevant because poverty creates barriers to access including health services, healthy food, and other necessities that contribute to poor health status.
Education

Among the Metro Area population age 25 and older, an estimated 9.1% (over 49,000 people) do not have a high school education.

- More favorable than found nationally.
- Lack of a high school diploma is highest in Douglas and Pottawattamie counties.
Population With No High School Diploma
(Population Age 25+ Without a High School Diploma or Equivalent, 2012-2016)

- Note the following map of residents age 25+ without high school diplomas.

Sources: • US Census Bureau American Community Survey 5-year estimates (2012-2016).

Notes: • This indicator is relevant because educational attainment is linked to positive health outcomes.
Employment

According to data derived from the US Department of Labor, the unemployment rate in the Metro Area as of November 2017 was 2.5%.

- Similar to the statewide unemployment rates.
- More favorable than the national unemployment rate.
- TREND: Unemployment for the Metro Area has trended downward since 2010, echoing the state and national trends.

### Unemployment Rate

(Percent of Non-Institutionalized Population Age 16+ Unemployed, Not Seasonally-Adjusted)

Notes: This indicator is relevant because unemployment creates financial instability and barriers to access including insurance coverage, health services, healthy food, and other necessities that contribute to poor health status.

Housing

**Housing Insecurity**

While most surveyed adults rarely, if ever, worry about the cost of housing, a considerable share (20.1%) reported that they were “sometimes,” “usually,” or “always” worried or stressed about having enough money to pay their rent or mortgage in the past year.
Frequency of Worry or Stress Over Paying Rent/Mortgage in the Past Year
(Metro Area, 2018)

- Always 4.6%
- Usually 3.9%
- Sometimes 11.6%
- Rarely 18.8%
- Never 61.1%

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 71]
Notes: Asked of all respondents.

NOTE:
Differences noted in the text represent significant differences determined through statistical testing.
Where sample sizes permit, community-level data are provided.
Trends are measured against baseline data – i.e., the earliest year that data are available or that is presented in this report.

- Compared to the US prevalence, the Metro Area proportion of adults who worried about paying for rent or mortgage in the past year is more favorable.
- Viewed by county, respondents in Pottawattamie County were most likely to report concerns about making housing payments.
  - Within Douglas County, housing insecurity appears highest in the Northeast.

“Always/Usually/Sometimes” Worried About Paying Rent/Mortgage in the Past Year
Adults more likely to report housing insecurity include women, young adults, residents living at lower incomes, as well as Black and Hispanic residents.

“Always/Usually/Sometimes” Worried About Paying Rent/Mortgage in the Past Year (Metro Area, 2018)

Housing Conditions

Among surveyed respondents, 5.2% went without electricity, water, or heating in their home within the past year.

- By county, the percentage is higher among Sarpy and Cass County respondents.
  - Within Douglas County, favorably low in Northwest Omaha.
Went Without Electricity, Water, or Heating in the Past Year

- Adults more likely to have gone without electricity, water, or heat in their home in the past year include men, older residents (positive correlation with age), and lower-income adults (negative correlation with income).
- Differences by race/ethnicity are not statistically significant.

Went Without Electricity, Water, or Heating in the Past Year
(Metro Area, 2018)
In a related inquiry, 6.1% of Metro Area adults report having ongoing problems with water leaks, rodents, insects, mold, or other housing conditions that might make living there unhealthy or unsafe in the past year.

- Douglas County residents gave a relatively high proportion of responses (Cass County results, although high, are not statistically significant versus the other counties due to a lower Cass County sample size).
  - Within Douglas County, highest in Northeast Omaha.

**Ongoing Problems With Water Leaks, Rodents, Insects, Mold, or Other Unhealthy Housing Conditions in the Past Year**

- Adults more likely to report these types of unhealthy housing conditions include young adults, those in low-income households (especially), and Black residents.
Ongoing Problems With Water Leaks, Rodents, Insects, Mold, or Other Unhealthy Housing Conditions in the Past Year (Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 326]
Notes: Asked of all respondents.
Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Transportation
While the vast majority of Metro Area adults report owning their own vehicle for transportation purposes, 5.1% rely on other means of transportation.

- A total of 2.7% have someone else who drives them around, 1.1% rely on public transportation, and 0.5% walk.

Primary Form of Transportation
(Metro Area, 2018)

Food Insecurity
While most survey respondents did not have concerns over affording enough food in the past year, 11.3% “often” or “sometimes” worried about their food running out before they had money for more.

- More favorable than national findings.
- Highest in Douglas County.
  - Considerably higher in Northeast Omaha.
- TREND: Denotes a statistically significant decrease from previous survey findings.
Those more likely to report difficulty getting fresh fruits and vegetables include:

- Women.
- Young adults.
- Lower-income residents (especially).
- Non-Whites.

“Often” or “Sometimes” Worry About Food Running Out Before Having Money to Buy More
(Metro Area, 2018)
Health Literacy

A total of 13.0% of Metro Area adults are found to have low health literacy.

Low health literacy in the Metro Area is:

- Well below the national findings.
- Similar among counties.
  - Much higher in the eastern portion of Douglas County.

Low Health Literacy

Sources:
- 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 172]
- 2017 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Respondents with low health literacy are those who “seldom/never” find written or spoken health information easy to understand, and/or who “always/nearly always” need help reading health information, and/or who are “not at all confident” in filling out health forms.
These Metro Area adults are more likely to have low levels of health literacy:

- Seniors (65+).
- Low-income residents.
- Black residents.
- Hispanics.

### Understanding Health Information

The following individual measures are used to determine the health literacy levels described above.

#### Written & Spoken Information

While a majority of Metro Area adults generally find health information to be easy to understand, 7.3% experience some difficulty with written health information and 5.4% experience some difficulty with spoken health information (responding “seldom” or “never” easy to understand).
Frequency With Which Health Information Is _______ in a Way That is Easy to Understand  
(Metro Area, 2018)

Written

Spoken

Sources:  ● 2018 PRC Community Health Survey, Professional Research Consultants, Inc.  [Items 74, 76]
Notes:  ● Asked of all respondents.

Reading Health Information & Completing Health Forms

A total of 3.3% of Metro Area adults “always” or “nearly always” need to have someone help them read health information.

A total of 2.1% of adults are “not at all confident” in their ability to fill out health forms by themselves.

Frequency of Needing Help Reading Health Information  
(Metro Area, 2018)

Confidence in Ability to Fill Out Health Forms  
(Metro Area, 2018)

Respondents were read:  “People who might help you read health information include family members, friends, caregivers, doctors, nurses, or other health professionals. How often do you need to have someone help you read health information?”

“Health forms include insurance forms, questionnaires, doctor’s office forms, and other forms related to health and health care. In general, how confident are you in your ability to fill out health forms yourself?”
Adverse Childhood Experiences (ACEs)

About ACEs

Adverse Childhood Experiences (ACEs) are stressful or traumatic events, including abuse and neglect. They are a significant risk factor for substance abuse disorders and can impact prevention efforts. ACEs include:

- Physical abuse
- Sexual Abuse
- Emotional abuse
- Physical neglect
- Emotional neglect
- Intimate partner violence
- Mother treated violently
- Household substance misuse
- Household mental illness
- Parental separation/divorce
- Incarcerated household member

A series of 11 survey questions were used to identify adults’ experiences of adverse childhood events prior to the age of 18 years. These 11 questions align with 8 ACEs categories, as outlined in the following table.

### Adverse Childhood Experiences (ACEs)

(Metro Area, 2018)

<table>
<thead>
<tr>

| Household Substance Abuse       | Before you were 18 years of age, did you live with anyone who was a problem drinker or alcoholic?  
                                 | Before you were 18 years of age, did you live with anyone who used illegal street drugs or who abused prescription medications? |
| Incarcerated Household Member   | Before you were 18 years of age, did you live with anyone who served time or was sentenced to serve time in a prison, jail, or other correctional facility? |
| Parental Separation or Divorce  | Before you were 18 years of age, were your parents separated or divorced?                  |
| Intimate Partner Violence       | Before age 18, how often did your parents or adults in your home slap, hit, kick, punch or beat each other up? |
| Physical Abuse                  | Before age 18, how often did a parent or adult in your home hit, beat, kick, or physically hurt you in any way? Do not include spanking. |
| Emotional Abuse                 | Before age 18, how often did a parent or adult in your home swear at you, insult you, or put you down? |
| Sexual Abuse                    | Before you were 18 years of age, how often did an adult or anyone at least 5 years older than you touch you sexually? |
                                 | Before you were 18 years of age, how often did an adult or anyone at least 5 years older than you try to make you touch them sexually? |
                                 | Before you were 18 years of age, how often did an adult or anyone at least 5 years older than you force you to have sex? |

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Items 363-370]
Notes: Reflects the total sample of respondents.
By category, ACEs were most prevalent in the Metro Area for emotional abuse (affirmed by 37.0% of respondents), followed by substance abuse (26.4%), and parental separation/divorce (23.6%).

- Fewer residents experienced physical abuse (17.8%), mental illness (17.6%), or intimate partner violence (16.1%) in the household.
- A total of 12.6% of survey respondents were affected by sexual abuse as a child, and 5.7% reported having had an incarcerated household member.

Notes: Asked of all respondents.
Includes respondents reporting ACE or ACEs corresponding to each category.

Prevalence of ACE Categories by County
(Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 371]
Notes: Asked of all respondents.
Includes respondents reporting ACE or ACEs corresponding to each category.
High ACE Scores

In scoring the series of 11 ACE questions, survey respondents receive one “point” for each affirmative response. A score of 4 or higher is determined to be a “high” ACE score.

In all, 15.1% of Metro Area residents reported 4 or more of the adverse childhood experiences tested (a high ACE score).

- Significantly higher in Sarpy County than in the other counties.
  - Within Douglas County, particularly high in Northeast Omaha.

### Prevalence of High ACE Scores (4 or More)
(Metro Area, 2018)

<table>
<thead>
<tr>
<th>Location</th>

2. Reflects the total sample of respondents.
3. Adults who report four or more ACEs is categorized as having a high ACE score.
4. Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
5. Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.

Relationship of ACEs with Other Health Issues

As a person’s ACE score increases, so does their risk for disease, social issues, and emotional problems.

Note the following strong correlations of various health indicators in the Metro Area, comparing those reporting no ACEs with those with low (1-3) and high (4+) ACE risk.

Relationship of ACEs With Other Issues  
(By ACE Risk Classification; Metro Area, 2018)
General Health Status
Overall Health Status

Evaluation of Health Status

A total of 57.4% of Metro Area adults rate their overall health as “excellent” or “very good.”

- Another 30.2% gave “good” ratings of their overall health.

**Self-Reported Health Status**
(Metro Area, 2018)

- Excellent: 19.8%
- Very Good: 37.6%
- Good: 30.2%
- Fair: 10.1%
- Poor: 2.3%

However, 12.4% of Metro Area adults believe that their overall health is “fair” or “poor.”

- Better than Nebraska and US findings (similar to Iowa).
- Viewed by county, residents of Douglas County gave the highest response.
  - Within Douglas County, unfavorably high in Northeast and Southeast Omaha.
- TREND: No statistically significant change has occurred when comparing “fair/poor” overall health reports to previous survey results.
Experience “Fair” or “Poor” Overall Health

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 5]
- 2017 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.

Longer historical survey data are available for Douglas County dating back to 2002, and for Sarpy/Cass counties since 2008.

- TREND: When trending Douglas County and combined Sarpy/Cass County results over time, there are no statistically significant changes to report.
Metro Area adults more likely to report experiencing “fair” or “poor” overall health include:

- Residents living at lower incomes.
- Black and Hispanic residents.

**Experience “Fair” or “Poor” Overall Health**
(Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 5]

Notes:
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Activity Limitations

About Disability & Health

An individual can get a disabling impairment or chronic condition at any point in life. Compared with people without disabilities, people with disabilities are more likely to:

- Experience difficulties or delays in getting the health care they need.
- Not have had an annual dental visit.
- Not have had a mammogram in past 2 years.
- Not have had a Pap test within the past 3 years.
- Not engage in fitness activities.
- Use tobacco.
- Be overweight or obese.
- Have high blood pressure.
- Experience symptoms of psychological distress.
- Receive less social-emotional support.
- Have lower employment rates.

There are many social and physical factors that influence the health of people with disabilities. The following three areas for public health action have been identified, using the International Classification of Functioning, Disability, and Health (ICF) and the three World Health Organization (WHO) principles of action for addressing health determinants.

- **Improve the conditions of daily life** by: encouraging communities to be accessible so all can live in, move through, and interact with their environment; encouraging community living; and removing barriers in the environment using both physical universal design concepts and operational policy shifts.
- **Address the inequitable distribution of resources among people with disabilities and those without disabilities** by increasing: appropriate health care for people with disabilities; education and work opportunities; social participation; and access to needed technologies and assistive supports.
- **Expand the knowledge base and raise awareness about determinants of health for people with disabilities** by increasing: the inclusion of people with disabilities in public health data collection efforts across the lifespan; the inclusion of people with disabilities in health promotion activities; and the expansion of disability and health training opportunities for public health and health care professionals.

The prevalence of activity limitations among Metro Area adults was 20.2%, which is less favorable than the prevalence in Nebraska (statistically similar to the Iowa prevalence) and more favorable than the national prevalence. Similar findings were observed among the Metro Area’s four counties, with favorably low rates in Western Douglas County. The trend was statistically unchanged over time.
### Limited in Activities in Some Way
Due to a Physical, Mental or Emotional Problem

*TREND: No statistically significant change has occurred when comparing activity limitations in Douglas County and Sarpy/Cass counties to baseline survey data.*

---

**Notes:**
- Asked of all respondents.

---

**Sources:**
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 109]
- 2017 PRC National Health Survey, Professional Research Consultants, Inc.
In looking at responses by key demographic characteristics, these Metro Area adults are statistically more likely to report some type of activity limitation:

- Women.
- Adults age 40 and older (note the positive correlation with age).
- Those in lower-income households (negative correlation with income).

### Limited in Activities in Some Way
**Due to a Physical, Mental or Emotional Problem**
(Metro Area, 2018)

Among persons reporting activity limitations, these are most often attributed to musculoskeletal issues, such as arthritis/rheumatism, back/neck problems, fractures or bone/joint injuries, or difficulty walking.
### Type of Problem That Limits Activities

Notes:
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Mental Health

About Mental Health & Mental Disorders

Mental health is a state of successful performance of mental function, resulting in productive activities, fulfilling relationships with other people, and the ability to adapt to change and to cope with challenges. Mental health is essential to personal well-being, family and interpersonal relationships, and the ability to contribute to community or society. Mental disorders are health conditions that are characterized by alterations in thinking, mood, and/or behavior that are associated with distress and/or impaired functioning. Mental disorders contribute to a host of problems that may include disability, pain, or death. Mental illness is the term that refers collectively to all diagnosable mental disorders. Mental disorders are among the most common causes of disability. The resulting disease burden of mental illness is among the highest of all diseases.

Mental health and physical health are closely connected. Mental health plays a major role in people’s ability to maintain good physical health. Mental illnesses, such as depression and anxiety, affect people’s ability to participate in health-promoting behaviors. In turn, problems with physical health, such as chronic diseases, can have a serious impact on mental health and decrease a person’s ability to participate in treatment and recovery.

The existing model for understanding mental health and mental disorders emphasizes the interaction of social, environmental, and genetic factors throughout the lifespan. In behavioral health, researchers identify: risk factors, which predispose individuals to mental illness; and protective factors, which protect them from developing mental disorders. Researchers now know that the prevention of mental, emotional, and behavioral (MEB) disorders is inherently interdisciplinary and draws on a variety of different strategies. Over the past 20 years, research on the prevention of mental disorders has progressed. The major areas of progress include evidence that:

- MEB disorders are common and begin early in life.
- The greatest opportunity for prevention is among young people.
- There are multiyear effects of multiple preventive interventions on reducing substance abuse, conduct disorder, antisocial behavior, aggression, and child maltreatment.
- The incidence of depression among pregnant women and adolescents can be reduced.
- School-based violence prevention can reduce the base rate of aggressive problems in an average school by 25 to 33%.
- There are potential indicated preventive interventions for schizophrenia.
- Improving family functioning and positive parenting can have positive outcomes on mental health and can reduce poverty-related risk.
- School-based preventive interventions aimed at improving social and emotional outcomes can also improve academic outcomes.
- Interventions targeting families dealing with adversities, such as parental depression or divorce, can be effective in reducing risk for depression in children and increasing effective parenting.
- Some preventive interventions have benefits that exceed costs, with the available evidence strongest for early childhood interventions.
- Implementation is complex, and it is important that interventions be relevant to the target audiences.
- In addition to advancements in the prevention of mental disorders, there continues to be steady progress in treating mental disorders as new drugs and stronger evidence-based outcomes become available.

Evaluation of Mental Health Status

A total of 69.8% of Metro Area adults rate their overall mental health as “excellent” or “very good.”

- Another 21.9% gave “good” ratings of their own mental health status.

Self-Reported Mental Health Status
(Metro Area, 2018)

- Excellent 34.0%
- Very Good 35.8%
- Good 21.9%
- Fair 6.4%
- Poor 1.9%

A total of 8.3% of Metro Area adults, however, believe that their overall mental health is “fair” or “poor.”

- More favorable than the “fair/poor” response reported nationally.
- Similar findings by county.
  - Within Douglas County, worst in Southeast Omaha.
- TREND: Statistically unchanged since 2011.

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 99]
Notes: Asked of all respondents.
Experience “Fair” or “Poor” Mental Health

TREND: Statistically unchanged over time in Douglas County as well as in the combined Sarpy/Cass counties area.

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 99]
Notes: Asked of all respondents.
Note the negative correlations between poor mental health and both age and income.
• In addition, women and Hispanics are more likely to report experiencing “fair/poor” mental health than their demographic counterparts.

Experience “Fair” or “Poor” Mental Health
(Metro Area, 2018)

Depression
Diagnosed Depression
A total of 19.5% of Metro Area adults have been diagnosed by a physician as having a depressive disorder (such as depression, major depression, dysthymia, or minor depression).
• Higher than both state proportions.
• Similar to the national finding.
• Similar findings by county.
  o Within Douglas County, statistically low in Southwest Omaha and Western Douglas.
Have Been Diagnosed With a Depressive Disorder

Sources: PRC Community Health Survey, Professional Research Consultants, Inc. [Item 102]
2017 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Depressive disorders include depression, major depression, dysthymia, or minor depression.

- Women, young adults, and low-income residents (especially) are much more likely to report a diagnosis of depression than their demographic counterparts.

Have Been Diagnosed With Depressive Disorder (Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 102]

Notes:
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Symptoms of Chronic Depression

A total of 26.3% of Metro Area adults have had two or more years in their lives when they felt depressed or sad on most days, although they may have felt okay sometimes (symptoms of chronic depression).

- More favorable than national findings.
- By county, highest in Douglas County and lowest in Sarpy County.
  - Unfavorably high in the eastern portion of Douglas County.
- TREND: Statistically unchanged over time.

Have Experienced Symptoms of Chronic Depression

Source: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 100]

Notes: Asked of all respondents.
Chronic depression includes periods of two or more years during which the respondent felt depressed or sad on most days, even if (s)he felt okay sometimes.

- TREND: Statistically unchanged over time in Douglas County, but marking a statistically significant increase since 2008 for Sarpy/Cass counties.
Note that the prevalence of chronic depression is notably higher among:

- Women.
- Adults under age 65 (negative correlation).
- Adults with lower incomes (negative correlation).
- Hispanics and non-White race groups.

### Stress

More than 4 in 10 Metro Area adults consider their typical day to be “not very stressful” (32.6%) or “not at all stressful” (14.4%).

- Another 43.0% of survey respondents characterize their typical day as “moderately stressful.”

**RELATED ISSUE:**  
See also Substance Abuse in the Modifiable Health Risks section of this report.
In contrast, 10.0% of Metro Area adults experience “very” or “extremely” stressful days on a regular basis.

- More favorable than national findings.
- Lowest in Cass County, highest in Douglas County.
  - Within Douglas County, similar findings by community.
- TREND: Statistically similar to the 2011 findings.
TREND: No significant change over time for Douglas County, but marking a statistically significant decrease in Sarpy/Cass counties since the 2008 findings.

Perceive Most Days As “Extremely” or “Very” Stressful

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 101]
Notes: Asked of all respondents.

Note that high stress levels are more prevalent among adults under age 65, those living just above the federal poverty level, and Hispanics.

Perceive Most Days as “Extremely” or “Very” Stressful
(Metro Area, 2018)

Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Emotional Support
Most Metro Area adults (86.1%) report having someone to turn to for emotional support “all” or “most” of the time.

- By county, the prevalence is lowest in Douglas County.
  - This prevalence is lower in the eastern portion of Douglas County.

Note that reliable emotional support is notably less prevalent among:

- Adults with lower incomes (positive correlation with income).
- Hispanics.

Notes: Asked of all respondents.
Suicide

Between 2014 and 2016, there was an annual average age-adjusted suicide rate of 12.0 deaths per 100,000 population in the Metro Area.

- Lower than the statewide and US rates.
- Fails to satisfy the Healthy People 2020 target of 10.2 or lower.
- Note the higher rate reported in Pottawattamie County.

Suicide: Age-Adjusted Mortality

Mental Health Treatment
A total of 31.6% of Metro Area adults acknowledge having ever sought professional help for a mental or emotional problem.

A total of 14.4% are currently taking medication or receiving treatment from a doctor or other health professional for some type of mental health condition or emotional problem.

- Both percentages are comparable to national proportions.

Mental Health Treatment

Sources:
- 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Items 103-104]
- 2017 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Reflects the total sample of respondents.
Among adults who have been diagnosed with depression, most (89.5%) have sought professional help for their mental or emotional problem.

- Similar to the US proportion.
- Viewed by county, Douglas County adults with depression are less likely to have sought professional help.
  - Within Douglas County, the prevalence is notably lower in the eastern portion of Omaha.

- Reflects those respondents with diagnosed depression.
- *Use caution when interpreting these results as sample sizes fall below 50.

### Difficulty Accessing Mental Health Services

A total of 2.7% of Metro Area adults report a time in the past year when they needed mental health services, but were not able to get them.

- Well below the national finding.
- Responses were particularly low in Pottawattamie and Cass counties (note that the Cass County percentage is based on a raw sample that is below 50 respondents).
  - Within Douglas County, the prevalence is least favorable in the eastern portions of Omaha.
Unable to Get Mental Health Services
When Needed in the Past Year

(Metro Area, 2018)

Note that access difficulty is notably more prevalent among:

- Adults under age 65 (negative correlation with age).
- Adults with lower incomes (negative correlation with income).
- Hispanics.

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 105]

Notes: Asked of all respondents.
Among persons citing difficulties accessing mental health services in the past year, these are predominantly attributed to **cost or insurance issues** (mentioned by 32.7%); other barriers mentioned include poor availability of resources, poor insurance coverage, and lack of knowledge about where to seek help.

### Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

#### Access to Care/Services

- There are no local long-term care services available for adults with chronic mental health issues. Also, not sufficient training and resources for community-based support. – Business Leader, Pottawattamie County
- A cohesive delivery system and sufficient resources to make services available and accessible. – Community Leader, Douglas County
Access to treatment, affordability, entry into a fragmented and confusing system. Police as first responders in many cases. County jail serving as the largest mental health facility in the state. One in four families impacted. Shortage of providers. – Community Leader, Douglas County

Do not feel that there are enough resources available for people and the majority of the population suffering from mental illness are untreated and not on medications. – Other Health Provider, Douglas County

Access to services, transportation, mobility issues, rural areas, insurance does not always cover tele-mental health, insurance coverage, waiting list, individuals in long-term care settings. – Other Health Provider, Douglas County

Access to mental health and payment for mental health. Stigma. – Social Services Provider, Douglas County

Access to appointments without long wait times, affordability. – Social Services Provider, Douglas County

Lack of resources available. Omaha and the State of Nebraska has fallen greatly behind. – Community Leader, Douglas County

Burden is there but not as high but that which is there has trouble finding services. – Business Leader, Douglas County

Patients must wait weeks to be seen for mental health care. They don't have insurance and they can't pay for it. They get frustrated and turn to illegal street drugs to help cope in the meantime. Not enough providers to see the amount of people. – Public Health Representative, Pottawattamie County

Large needs and insufficient resources. – Social Services Provider, Douglas County

Access to crisis intervention services and acute care for children and adults. Stigma associated with mental health. Mental health providers who can serve immigrants and refugees. Timely access to psychological and psychiatric evaluations. Awareness. – Social Services Provider, Douglas County

Accessing appropriate services. Going for help, receiving needed help and having the ability to pay for the help. – Public Health Representative, Pottawattamie County

Heard mental health facilities are full and require a long wait time. Mental health treatment is also focused more on drugging the patient to subdue them, rather than truly working to lift up the individual person and his or her gifts. – Business Leader, Douglas County

There are no community services or programs to address the needs of acute or chronic mental health needs. – Social Services Provider, Douglas County

Access to appropriate and timely services and interventions. Lack of sufficient funding. – Social Services Provider, Douglas County

No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. Very high need for services in Cass County, no local providers available. – First Responder, Cass County

Being able to access services, limited availability for psychiatric care, medications, lack of health insurance, substance abuse, transportation to get to appointments. – Social Services Provider, Pottawattamie County

They do not have a simple, uncomplicated system to receive services and treatment, and sometimes become discouraged and stop trying to get better. – Business Leader, Pottawattamie County

Access to mental health care is very limited and the range of options is narrow. – Social Services Provider, Douglas County

Access to help. – Social Services Provider, Douglas County

There are virtually no programs for people with mental health problems, particularly mental illness. The community lacks psychiatrists and clinical psychologists. Community members don’t know where to go for services. There are not enough SUD services. – Social Services Provider, Douglas County

Access to the appropriate level of care. Transportation to appointments. Ability to pay. – Social Services Provider, Douglas County

Sarpy County Jail is full of arrestees with mental illness. Many should not be there. Where do they go. – Criminal Justice, Sarpy County

Not enough services available due to lack of funding and a small workforce. – Social Services Provider, Douglas County

No access to any type of services. – Social Services Provider, Douglas County

Inability to seek treatment. – Social Services Provider, Douglas County

Limited medical facilities. – Business Leader, Pottawattamie County

Lack of services. – Social Services Provider, Douglas County

Access to mental health specialists for evaluation and treatment is very limited. – Physician, Douglas County
Little to no access for people without health care coverage or with health care coverage that does not cover mental health services. Finding culturally sensitive health care services. – Social Services Provider, Douglas County

In my opinion, mental health challenges include access to mental health professionals in a timely manner. Recently, I had an experience where a woman needed care and the only way to access this care was through the Emergency Department. – Business Leader, Pottawattamie County

Those with mental health issues often miss their appointments due to poor time management, lack of organization and planning. Mental health providers then drop them and won't provide services for them. Also finding the right medication and therapy. – Business Leader, Pottawattamie County

The County Correction Facility is the largest Mental Health facility in Douglas County. Mental health seems to be basis of many health outcomes, as well as violence. – Public Health Representative, Douglas County

Funding doesn't support integrated or collaborative care, model is a huge problem with Medicaid. Issues with Telehealth regulations for community health centers. Region Six has insane amount of worthless documentation needs, lack of services for Spanish. – Physician, Douglas County

Lack of Providers

Very few providers, only CHI and VA, for inpatient. Significant lack of education, understanding. Community Alliance great model but need more. – Community Leader, Douglas County

Limited number of mental health provider in Pottawattamie County. Chronic care turnaround isn't well-managed. Takes way too long for patients to be seen. Many patients are routed to the ED and not well-managed. Immediate crisis is not available. – Other Health Provider, Pottawattamie County

There is a lack of mental health providers in the community, even for families with health care coverage. – Community Leader, Douglas County

Access to trained professionals. – Other Health Provider, Pottawattamie County

Lack of capacity of providers, lack of training for existing providers around trauma and affordability. – Social Services Provider, Douglas County

The lack of practitioners is one the single largest barriers we face currently in evaluating, diagnosing, and treating people with mental health conditions in our community. – Social Services Provider, Douglas County

Lack of mental health providers, especially highly trained and quality providers, more providers of color needed, access to residential treatment for severely mentally ill, removing the stigma of accessing treatment for mental illness. – Social Services Provider, Pottawattamie County

Not enough providers. People have to wait several months before being seen. Often treatment is insufficient for the person's needs due to time constraints. – Social Services Provider, Pottawattamie County

Waiting lists for psychiatrists and psychologists. Adequate insurance coverage for mental health services and medications. – Social Services Provider, Douglas County

Access to providers, medications and building the capacity for integrated care, physical and behavioral health. – Public Health Representative, Douglas County

Access. Not enough providers to serve needs. – Physician, Pottawattamie County

Lack of access to mental health practitioners and resources for dealing with depression, mental health, stress. – Community Leader, Cass County

Lack of providers and inadequate community resources to address mental health issues and needs. – Social Services Provider, Douglas County

Lack of Inpatient Facilities

Lack of available beds. – Social Services Provider, Douglas County

The fact that there are very few treatment facilities, whether inpatient or outpatient, and that most of the residents in need of these limited services are unable to access them due to lack of insurance. – Other Health Provider, Douglas County

Not enough mental health treatment, facilities to meet the needs. Mental health issues too often handled by law enforcement. – Other Health Provider, Douglas County

Lack of inpatient beds and emergency stabilization and close appointments, even with no insurance. – Physician, Douglas County

Lack of in-patient resources. What to do with those that aren’t seriously mentally ill, but need help. – Criminal Justice – Sarpy County

Treatment facilities for inpatient care. – Social Services Provider, Douglas County
Limited numbers of inpatient psychiatric beds for adults, adolescents and children. The current inpatient psychiatric care is just a revolving door of short term crisis care. Longer care programs and partial hospitalization programs are needed. – Other Health Provider, Douglas County

Placement of patients in need of mental health services. Limited inpatient beds, patients bounce from one place to another. Limited adolescent beds. Mental health patients bedded in inpatient settings add a danger for others. – Other Health Provider, Douglas County

No enough mental health beds in this city. For non-stat issues, wait times can be three months or longer for an open bed. Emergency Rooms are flooded with mental health patients. Laws need to be changed so adult children can be forced to seek help. – Other Health Provider, Douglas County

Lack of inpatient mental health facilities for youth. – Community Leader, Douglas County

Denial/Stigma

Recognition of need for mental health supports among residents and access to appropriate services. – Social Services Provider, Douglas County

Stigma to receive services. Culturally competent care, access to services, lack of providers. – Community Leader, Douglas County

Stigma is a major challenge for consumers. Treating mental health and physical health separately is a major issue within the health system. This leaves patients without the care that they need, without a recovery period back to the community. – Other Health Provider, Douglas County

People are stressed, behavioral and mental health is stigmatized in the Latino community. People are unsure how to access services, some are unable to pay for treatment. – Social Services Provider, Douglas County

Diagnosis/Treatment

Misdiagnosis, non-diagnosis, appropriate costs, locations and competent licensed staff, treatment services and access to affordable medications. – Community Leader, Douglas County

Undiagnosed behavioral/mental health among our youth ages 11 through 26. Primarily young black males, do not have insurance and cannot at times pay small nominal fees at our local community health centers for healthcare. – Social Services Provider, Douglas County

Undiagnosed cases among poverty population. – Social Services Provider, Douglas County

Difficulty in getting the correct diagnosis. Lack of providers. Lack of treatment facilities. Lack of a holistic approach, lack of funding. People not understanding it’s a problem, not personal failures. Stigma. – Social Services Provider, Douglas County

Incidence/Prevalence

Mental health is a key driver of all other capacities of health and wellness. There are still issues with stigma, lack of access, lack of effective reimbursement practices which impact access. Nebraska is one of the top major health issues. – Other Health Provider, Douglas County

I would have the same response as to my response on injury and violence. I believe they are interconnected. – Community Leader, Douglas County

Mental health is a growing issue across country and Omaha is no different. Many of the people who are arrested or use weapons for violence were abused or have mental issues. Increased efforts to help support these people would help to reduce violence. – Social Services Provider, Douglas County

Rampant mental health problems and little help. – Other Health Provider, Pottawattamie County

Affordable Care/Services

Lack of funding for proper treatment. – Community Leader, Douglas County

People without insurance or affordable insurance are unable to access care. The agencies providing free/sliding fee mental health services are overwhelmed, so people are unable to make appointments quickly when they need help. – Social Services Provider, Douglas County

High prevalence of mental health conditions and obtaining affordable, efficacious mental health services. There is a lack of providers both in the urban and rural areas of Douglas County. – Public Health Representative, Douglas County

Health Awareness/Education

Communities’ lack of knowledge, stigma of mental health. – Community Leader, Douglas County

Misunderstanding of mental health and lack of services for people suffering from mental health issues. – Community Leader, Douglas County
Lack of understanding and lack of access, affordability. – Community Leader, Douglas County

**Domestic Violence**
- Domestic abuse, violence listed in the public record and news media. – Social Services Provider, Douglas County

**Health Disparities**
- Culturally appropriate and accessible mental health services and access to medications when needed. – Social Services Provider, Douglas County

**Lack Emergency/Crisis Services**
- Emergency care that is sufficient to address the crisis and put a plan in place for follow up care. – Social Services Provider, Douglas County

**Disease Management Challenges**
- Compliance with counseling and treatment for mental health, cost of mental healthcare, lack of substance abuse programs. – Advanced Practice Provider, Douglas County

**Suicide**
- Sarpy County is experiencing an influx of suicide attempts with very few options for outpatient care and even less for inpatient care. – Social Services Provider, Sarpy County
Death, Disease, & Chronic Conditions
Leading Causes of Death

Distribution of Deaths by Cause
Together, cardiovascular disease (heart disease and stroke) and cancers accounted for more than 4 in 10 deaths in the Metro Area in 2016.

Leading Causes of Death
(Metro Area, 2016)

- Heart Disease 22.6%
- Cancer 18.4%
- Other Conditions 35.4%
- CLRD 6.4%
- Stroke 5.2%
- Unintentional Injuries 4.9%
- Alzheimer's Disease 4.4%
- Diabetes 2.7%

Sources: CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted March 2018.
Notes: Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
CLRD is chronic lower respiratory disease.

Age-Adjusted Death Rates for Selected Causes
In order to compare mortality in the region with other localities (in this case, Nebraska, Iowa, and the United States), it is necessary to look at rates of death — these are figures which represent the number of deaths in relation to the population size (such as deaths per 100,000 population, as is used here).
Furthermore, in order to compare localities without undue bias toward younger or older populations, the common convention is to adjust the data to some common baseline age distribution. Use of these “age-adjusted” rates provides the most valuable means of gauging mortality against benchmark data, as well as Healthy People 2020 targets.
The following chart outlines 2014-2016 annual average age-adjusted death rates per 100,000 population for selected causes of death in the Metro Area.
Each of these is discussed in greater detail in subsequent sections of this report.
### Age-Adjusted Death Rates for Selected Causes

**Sources:**
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted March 2018.

**Note:**
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population and coded using ICD-10 codes.
- *The Healthy People 2020 Heart Disease target is adjusted to account for all diseases of the heart; the Diabetes target is adjusted to reflect only diabetes mellitus-coded deaths.*
Heart disease is the leading cause of death in the United States, with stroke following as the third leading cause. Together, heart disease and stroke are among the most widespread and costly health problems facing the nation today, accounting for more than $500 billion in healthcare expenditures and related expenses in 2010 alone. Fortunately, they are also among the most preventable.

The leading modifiable (controllable) risk factors for heart disease and stroke are:

- High blood pressure
- High cholesterol
- Cigarette smoking
- Diabetes
- Poor diet and physical inactivity
- Overweight and obesity

The risk of Americans developing and dying from cardiovascular disease would be substantially reduced if major improvements were made across the US population in diet and physical activity, control of high blood pressure and cholesterol, smoking cessation, and appropriate aspirin use.

The burden of cardiovascular disease is disproportionately distributed across the population. There are significant disparities in the following based on gender, age, race/ethnicity, geographic area, and socioeconomic status:

- Prevalence of risk factors
- Access to treatment
- Appropriate and timely treatment
- Treatment outcomes
- Mortality

Disease does not occur in isolation, and cardiovascular disease is no exception. Cardiovascular health is significantly influenced by the physical, social, and political environment, including: maternal and child health; access to educational opportunities; availability of healthy foods, physical education, and extracurricular activities in schools; opportunities for physical activity, including access to safe and walkable communities; access to healthy foods; quality of working conditions and worksite health; availability of community support and resources; and access to affordable, quality healthcare.

Age-Adjusted Heart Disease & Stroke Deaths

Heart Disease Deaths

Between 2014 and 2016 there was an annual average age-adjusted heart disease mortality rate of 143.2 deaths per 100,000 population in the Metro Area.

- Lower than the Iowa and US rates (similar to Nebraska).
- Satisfies the Healthy People 2020 target of 156.9 or lower (as adjusted to account for all diseases of the heart).
- Unfavorably high in Pottawattamie County.
Heart Disease: Age-Adjusted Mortality
(2014-2016 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 156.9 or Lower (Adjusted)

By race, the heart disease mortality rate is notably higher among Non-Hispanic Blacks when compared with Non-Hispanic Whites and Hispanics in the Metro Area.

Heart Disease: Age-Adjusted Mortality by Race
(2014-2016 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 156.9 or Lower (Adjusted)

TREND: The heart disease mortality rate has decreased in the Metro Area, echoing the decreasing trends across Nebraska, Iowa, and the US overall.
Heart Disease: Age-Adjusted Mortality Trends
(Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 156.9 or Lower (Adjusted)

### Data Overview
- **Metro Area**
  - 2007-2009: 163.6
  - 2008-2010: 159.3
  - 2009-2011: 154.8
  - 2010-2013: 152.6
  - 2011-2013: 151.3
  - 2012-2013: 150.4
  - 2013-2014: 151.2
  - 2014-2015: 143.2
  - 2014-2016: 143.2

- **Nebraska**
  - 2008-2010: 156.9
  - 2009-2011: 151.4
  - 2010-2013: 149.3
  - 2011-2013: 147.2
  - 2012-2013: 145.9
  - 2013-2014: 148.5
  - 2014-2015: 145.9
  - 2014-2016: 146.0

- **Iowa**
  - 2007-2009: 179.6
  - 2008-2010: 178.3
  - 2009-2011: 171.8
  - 2010-2013: 169.9
  - 2011-2013: 168.4
  - 2012-2013: 165.5
  - 2013-2014: 162.3
  - 2014-2015: 160.3
  - 2014-2016: 160.3

- **United States**
  - 2007-2009: 190.3
  - 2008-2010: 182.9
  - 2009-2011: 176.7
  - 2010-2013: 172.6
  - 2011-2013: 171.3
  - 2012-2013: 169.1
  - 2013-2014: 168.4
  - 2014-2015: 167.0
  - 2014-2016: 167.0

### Notes
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
- Local, state and national data are simple three-year averages.
- The Healthy People 2020 Heart Disease target is adjusted to account for all diseases of the heart.

### Stroke Deaths
Between 2014 and 2016, there was an annual average age-adjusted stroke mortality rate of 35.4 deaths per 100,000 population in the Metro Area.

- Similar to the Nebraska and national rates (higher than the Iowa rate).
- Similar to the Healthy People 2020 target of 34.8 or lower.
- Douglas and Pottawattamie County rates were much higher than those reported in Sarpy and Cass counties.

### Stroke: Age-Adjusted Mortality
(2014-2016 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 34.8 or Lower

### Data Overview
- **Douglas County**
  - 2014-2016: 36.3

- **Sarpy County**
  - 2014-2016: 29.3

- **Cass County**
  - 2014-2016: 33.0

- **Pott. County**
  - 2014-2016: 39.9

- **Metro Area**
  - 2014-2016: 35.4

- **NE**
  - 2014-2016: 33.8

- **IA**
  - 2014-2016: 33.2

- **US**
  - 2014-2016: 37.1

### Notes
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
The stroke mortality rate is considerably higher among Non-Hispanic Blacks when compared with Non-Hispanic Whites and Hispanics in the Metro Area.

**Stroke: Age-Adjusted Mortality by Race**
(2014-2016 Annual Average Deaths per 100,000 Population)
*Healthy People 2020 Target = 34.8 or Lower*

- **Metro Area**
  - Non-Hispanic White: 34.3
  - Non-Hispanic Black: 55.7
  - Hispanic: 27.6
  - All Races/Ethnicities: 35.4

**Notes:**
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.

**TREND:** The stroke rate has **declined** in recent years, echoing the trends reported statewide and nationally.

**Stroke: Age-Adjusted Mortality Trends**
(Annual Average Deaths per 100,000 Population)
*Healthy People 2020 Target = 34.8 or Lower*

**Sources:**
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted March 2018.

**Notes:**
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
Prevalence of Heart Disease & Stroke

Prevalence of Heart Disease

A total of 4.7% of surveyed adults report that they suffer from or have been diagnosed with heart disease, such as coronary heart disease, angina, or heart attack.

- More favorable than the national prevalence.
- Similar findings by county.
  - Similar findings by community within Douglas County.
- TREND: Statistically unchanged since 2011.

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 311]
Notes: Asked of all respondents. Includes diagnoses of heart attack, angina or coronary heart disease.
Adults more likely to have been diagnosed with chronic heart disease include:

- Men.
- Seniors (positive correlation with age).
- Residents in low-income households (negative correlation with age).

### Prevalence of Heart Disease
(Metro Area, 2018)

#### Prevalence of Stroke
A total of 2.4% of surveyed adults report that they suffer from or have been diagnosed with cerebrovascular disease (a stroke).

- Similar to statewide findings, and lower than national findings.
- Similar findings by county.
  - Favorably low in Western Douglas County.
- TREND: The stroke prevalence is statistically unchanged over time.
Prevalence of Stroke

**Sources:**
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 33]

**Notes:**
- Asked of all respondents.

- TREND: Statistically unchanged over time in Douglas County, but marking a statistically significant increase in stroke prevalence for Sarpy/Cass counties.

**Prevalence of Stroke**

**Douglas County**

- 2.0% in 2008
- 1.8% in 2011
- 3.7% in 2015
- 2.3% in 2018

**Sarpy/Cass Counties**

- 0.9% in 2008
- 3.1% in 2011
- 1.1% in 2015
- 2.9% in 2018

**Sources:**
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 33]

**Notes:**
- Asked of all respondents.

Adults more likely to have been diagnosed with a stroke include:
- Older residents (positive correlation with age).
- Low-income residents (negative correlation with income).
Prevalence of Stroke
(Metro Area, 2018)

Key Informant Input: Heart Disease & Stroke

Equal shares of key informants taking part in an online survey characterized Heart Disease & Stroke as a “major problem” or a “moderate problem” in the community.

Perceptions of Heart Disease and Stroke as a Problem in the Community
(Key Informants, 2018)

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

Leading Cause of Death
Heart disease and stroke are among the four leading causes of death in Douglas County and the leading killer of women nationally. – Other Health Provider, Douglas County

The number of deaths resulting from heart disease and strokes. – Other Health Provider, Douglas County

Number two killer. – Other Health Provider, Douglas County

Leading cause of death. – Social Services Provider, Douglas County

Heart disease continues to be one of the leading causes of death, not just in our community, but nationwide. – Community Leader, Douglas County
Continues to be a leading cause of death and many are likely avoidable if individuals were practicing better health behaviors, which is difficult for many populations due to challenges with other social determinants of health. – Other Health Provider, Douglas County

Heart disease and stroke are one of the major causes of death in Douglas County. – Public Health Representative, Douglas County

It’s the number one killer of men and women after menopause. – Social Services Provider, Douglas County

In incidence/Prevalence

I read the Community Health Needs Assessment, plus I work with numerous healthcare providers and LiveWell Omaha. – Community Leader, Douglas County

Maybe because we hear more about these conditions in the media. – Social Services Provider, Douglas County

Data indicates that we have high rates of CVD and stroke. – Public Health Representative, Douglas County

High burden, low understanding and related to diabetes as is kidney disease. – Business Leader, Douglas County

As an emergency responder, heart disease and stroke are common response calls. – First Responder, Douglas County

Common cause of severe illness and death. – Community Leader, Douglas County

Contributing Factors

Food insecurity, housing insecurity, financial insecurity, neighborhood insecurity, education insecurity. – Social Services Provider, Douglas County

Incidence rate in general, aging population, disproportionate incidence across race, obesity levels. – Social Services Provider, Douglas County

Aging population, obesity and metabolic issues. – Other Health Provider, Douglas County

Due to stress, high blood pressure, smoking, alcohol, sodium intake and obesity. – Social Services Provider, Douglas County

Stress and diet. – Social Services Provider, Douglas County

Because of the lack of access to healthy food, exercise, and specialty care. I think a number of folks are walking around with the silent killer, hypertension. – Social Services Provider, Douglas County

Nutrition, Physical Activity & Weight

I believe that a lack of good diet and exercise are two of the many reasons why heart disease and stroke are on the rise in this area. Pottawattamie County is one of least educated, higher education, with one of the highest adverse childhood experiences. – Business Leader, Pottawattamie County

Poor diet and lack of exercise. – Social Services Provider, Douglas County

Improper diet and lack of exercise. – Community Leader, Douglas County

Poverty

Lower income population do not have routine examinations and have higher risk factors. – Other Health Provider, Douglas County

Too many poor women and men are suffering debilitating heart attacks and strokes in their 50s. Lack of effective community education. Chronic financial stress due to low wages and/or an inability to successfully manage their money in our community. – Social Services Provider, Douglas County

Access to Care/Services

No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County

Diagnosis/Treatment

Still major issues of diagnosis and prevention. Care is excellent, but after heart disease has progressed. – Community Leader, Douglas County

Health Disparities

The disparities are the challenge. Certain racial/ethnic groups are at greater risk. – Social Services Provider, Pottawattamie County
**Lifestyle**

These diseases are often connected to where a person lives and their ability to live a healthy life, whether they live in poverty or don't have access to healthy foods or a job that pays a livable wage. – Community Leader, Douglas County

**Prevention**

Lack of understanding of precautionary measures. I think sometimes the precautionary measures to manage disease seem much more difficult so that the strategies are avoided. The annual heart walk and Power to End Stroke efforts are phenomenal. – Social Services Provider, Douglas County

**Obesity/Overweight**

We have an obesity issue and heart disease and stroke go along with that. – Community Leader, Douglas County
Cancer

About Cancer

Continued advances in cancer research, detection, and treatment have resulted in a decline in both incidence and death rates for all cancers. Among people who develop cancer, more than half will be alive in five years. Yet, cancer remains a leading cause of death in the United States, second only to heart disease.

Many cancers are preventable by reducing risk factors such as: use of tobacco products; physical inactivity and poor nutrition; obesity; and ultraviolet light exposure. Other cancers can be prevented by getting vaccinated against human papillomavirus and hepatitis B virus. In the past decade, overweight and obesity have emerged as new risk factors for developing certain cancers, including colorectal, breast, uterine corpus (endometrial), and kidney cancers. The impact of the current weight trends on cancer incidence will not be fully known for several decades. Continued focus on preventing weight gain will lead to lower rates of cancer and many chronic diseases.

Screening is effective in identifying some types of cancers (see US Preventive Services Task Force [USPSTF] recommendations), including:

- Breast cancer (using mammography)
- Cervical cancer (using Pap tests)
- Colorectal cancer (using fecal occult blood testing, sigmoidoscopy, or colonoscopy)

- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Cancer Deaths

All Cancer Deaths

Between 2014 and 2016, there was an annual average age-adjusted cancer mortality rate of 166.2 deaths per 100,000 population in the Metro Area.

- Comparable to Iowa and US rates, but less favorable than the Nebraska rate.
- Similar to the Healthy People 2020 target of 161.4 or lower.
- Unfavorably high in Pottawattamie County.
Cancer: Age-Adjusted Mortality
(2014-2016 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 161.4 or Lower

- The cancer mortality rate is notably higher among Non-Hispanic Whites and especially Non-Hispanic Blacks when compared with Hispanics in the Metro Area.

Cancer: Age-Adjusted Mortality by Race
(2014-2016 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 161.4 or Lower

- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
TREND: Cancer mortality has decreased over the past decade in the Metro Area; the same trend is apparent in Nebraska and Iowa as well as nationally.

Cancer: Age-Adjusted Mortality Trends
(Annual Average Deaths per 100,000 Population)

Healthy People 2020 Target = 161.4 or Lower

State and national data are simple three-year averages.

Cancer Deaths by Site
Lung cancer is by far the leading cause of cancer deaths in the Metro Area.

Other leading sites include breast cancer among women, prostate cancer among men, and colorectal cancer (both sexes).

As evident in the following chart (referencing 2014-2016 annual average age-adjusted death rates):

- The Metro Area lung cancer death rate is similar to the Iowa rate, but less favorable than the Nebraska and US rates.
- The Metro Area prostate cancer death rate is higher than both states as well as the national rate.
- The Metro Area female breast cancer death rate is similar to the Nebraska and US rates, but higher than the Iowa rate.
- The Metro Area colorectal cancer death rate is similar to both state rates as well as the national rate.
- Note that each of the Metro Area cancer death rates detailed in the following chart is comparable to or satisfies the related Healthy People 2020 target.
Age-Adjusted Cancer Death Rates by Site

**Cancer Incidence**

Incidence rates reflect the number of newly diagnosed cases in a given population in a given year, regardless of outcome. These rates are also age-adjusted.

**The 2009-2013 Metro Area female breast cancer incidence rate is:**
- Similar to the Iowa and US rates, but higher than the Nebraska rate.
- Unfavorably high in Douglas and Sarpy counties.

**The Metro Area prostate cancer incidence rate is:**
- Similar to both state rates as well as the US rate.
- Higher in Douglas and Cass counties.

**The Metro Area lung cancer incidence rate is:**
- Worse than both state rates as well as the US rate.
- Unfavorably high in Douglas and Pottawattamie counties.

**The Metro Area colon/rectal cancer incidence rate is:**
- Similar to both state rates, but worse than the US rate.
- Higher in Pottawattamie County.

**The Metro Area cervical cancer incidence rate is:**
- More favorable than both state rates as well as the US rate.
- Unfavorably high in Douglas County.
Cancer Incidence Rates by Site
(Annual Average Age-Adjusted Incidence per 100,000 Population, 2009-2013)

Notes: This indicator reports the age adjusted incidence rate (cases per 100,000 population per year) of cancers, adjusted to 2000 U.S. standard population age groups (under age 1, 1-4, 5-9, ... 80-84, 85 and older). This indicator is relevant because cancer is a leading cause of death and it is important to identify cancers separately to better target interventions.

Prevalence of Cancer
A total of 9.2% of surveyed Metro Area adults report having been diagnosed with some type of cancer.

- Considerably higher in Cass County.
- Favorably low in Northeast Omaha.

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 310]
Notes: Asked of all respondents.
Adults more likely to have been diagnosed with cancer include:

- Older adults (strong, positive correlation with age).
- Low-income residents (negative correlation with age).
- Whites.

**Sources:**
2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 310]

**Notes:**
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.

### Cancer Risk

**About Cancer Risk**

Reducing the nation’s cancer burden requires reducing the prevalence of behavioral and environmental factors that increase cancer risk.

- All cancers caused by cigarette smoking could be prevented. At least one-third of cancer deaths that occur in the United States are due to cigarette smoking.
- According to the American Cancer Society, about one-third of cancer deaths that occur in the United States each year are due to nutrition and physical activity factors, including obesity.
- National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

---

COMMUNITY HEALTH NEEDS ASSESSMENT
Cancer Screenings

The American Cancer Society recommends that both men and women get a cancer-related checkup during a regular doctor’s checkup. It should include examination for cancers of the thyroid, testicles, ovaries, lymph nodes, oral cavity, and skin, as well as health counseling about tobacco, sun exposure, diet and nutrition, risk factors, sexual practices, and environmental and occupational exposures.

Screening levels in the community were measured in the PRC Community Health Survey relative to three cancer sites: female breast cancer (mammography); cervical cancer (Pap smear testing); and colorectal cancer (sigmoidoscopy and fecal occult blood testing).

Female Breast Cancer Screening

<table>
<thead>
<tr>
<th>About Screening for Breast Cancer</th>
</tr>
</thead>
<tbody>
<tr>
<td>The US Preventive Services Task Force (USPSTF) recommends screening mammography, with or without clinical breast examination (CBE), every 1-2 years for women age 40 and older.</td>
</tr>
</tbody>
</table>

**Rationale:** The USPSTF found fair evidence that mammography screening every 12-33 months significantly reduces mortality from breast cancer. Evidence is strongest for women age 50-69, the age group generally included in screening trials. For women age 40-49, the evidence that screening mammography reduces mortality from breast cancer is weaker, and the absolute benefit of mammography is smaller, than it is for older women. Most, but not all, studies indicate a mortality benefit for women undergoing mammography at ages 40-49, but the delay in observed benefit in women younger than 50 makes it difficult to determine the incremental benefit of beginning screening at age 40 rather than at age 50.

The absolute benefit is smaller because the incidence of breast cancer is lower among women in their 40s than it is among older women. The USPSTF concluded that the evidence is also generalizable to women age 70 and older (who face a higher absolute risk for breast cancer) if their life expectancy is not compromised by comorbid disease. The absolute probability of benefits of regular mammography increase along a continuum with age, whereas the likelihood of harms from screening (false-positive results and unnecessary anxiety, biopsies, and cost) diminish from ages 40-70. The balance of benefits and potential harms, therefore, grows more favorable as women age. The precise age at which the potential benefits of mammography justify the possible harms is a subjective choice. The USPSTF did not find sufficient evidence to specify the optimal screening interval for women age 40-49.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

**Mammography**

Among women age 50-74, 83.7% have had a mammogram within the past 2 years.

- More favorable than state and US findings.
- Satisfies the Healthy People 2020 target (81.1% or higher).
- Similar findings by county (the Cass County sample was too small to report).
  - Within Douglas County, similar findings by community.
- TREND: Statistically unchanged since 2011.
Have Had a Mammogram in the Past Two Years
(Among Women Age 50-74)

Healthy People 2020 Target = 81.1% or Higher

- 2017 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Reflects female respondents 50-74.
- *Sample size is too low to report percentage results with accuracy.

- TREND: Statistically unchanged over time for Douglas County and for Sarpy/Cass counties.

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 133]

Notes:
- Reflects female respondents 50-74.
Cervical Cancer Screenings

About Screening for Cervical Cancer

The US Preventive Services Task Force (USPSTF) strongly recommends screening for cervical cancer in women who have been sexually active and have a cervix.

Rationale: The USPSTF found good evidence from multiple observational studies that screening with cervical cytology (Pap smears) reduces incidence of and mortality from cervical cancer. Direct evidence to determine the optimal starting and stopping age and interval for screening is limited. Indirect evidence suggests most of the benefit can be obtained by beginning screening within 3 years of onset of sexual activity or age 21 (whichever comes first) and screening at least every 3 years. The USPSTF concludes that the benefits of screening substantially outweigh potential harms.

The USPSTF recommends against routinely screening women older than age 65 for cervical cancer if they have had adequate recent screening with normal Pap smears and are not otherwise at high risk for cervical cancer.

Rationale: The USPSTF found limited evidence to determine the benefits of continued screening in women older than 65. The yield of screening is low in previously screened women older than 65 due to the declining incidence of high-grade cervical lesions after middle age. There is fair evidence that screening women older than 65 is associated with an increased risk for potential harms, including false-positive results and invasive procedures. The USPSTF concludes that the potential harms of screening are likely to exceed benefits among older women who have had normal results previously and who are not otherwise at high risk for cervical cancer.

The USPSTF recommends against routine Pap smear screening in women who have had a total hysterectomy for benign disease.

Rationale: The USPSTF found fair evidence that the yield of cytologic screening is very low in women after hysterectomy and poor evidence that screening to detect vaginal cancer improves health outcomes. The USPSTF concludes that potential harms of continued screening after hysterectomy are likely to exceed benefits.

Pap Smear Testing

Among Metro Area women age 21 to 65, 82.5% have had a Pap smear within the past 3 years.

- More favorable than Nebraska and US findings; comparable to Iowa findings.
- Fails to satisfy the Healthy People 2020 target (93% or higher).
- Similar findings by county (the Cass County sample was too small for to report).
  - Lower among women in Northeast Omaha.
- TREND: Denotes a statistically significant decrease from 2011 survey findings.
Have Had a Pap Smear in the Past Three Years
(Among Women Age 21-65)
Healthy People 2020 Target = 93.0% or Higher

Notes:
- Reflects female respondents age 21 to 65.
- *Sample size is too low to report percentage results with accuracy.

**TREND:** Marks a statistically significant decrease over baseline findings in Douglas County; statistically unchanged over time in Sarpy/Cass counties.

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 134]
- 2017 PRC National Health Survey, Professional Research Consultants, Inc.
Colorectal Cancer Screenings

**About Screening for Colorectal Cancer**

The USPSTF recommends screening for colorectal cancer using fecal occult blood testing, sigmoidoscopy, or colonoscopy in adults, beginning at age 50 years and continuing until age 75 years.

The evidence is convincing that screening for colorectal cancer with fecal occult blood testing, sigmoidoscopy, or colonoscopy detects early-stage cancer and adenomatous polyps. There is convincing evidence that screening with any of the three recommended tests (fecal occult blood testing, sigmoidoscopy, colonoscopy) reduces colorectal cancer mortality in adults age 50 to 75 years. Follow-up of positive screening test results requires colonoscopy regardless of the screening test used.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

**Colorectal Cancer Screening**

Among adults age 50-75, 80.5% have had an appropriate colorectal cancer screening.

- Higher than the proportions in both states and similar to national findings.
- Satisfies the Healthy People 2020 target (70.5% or higher).
- Similar findings by county.
  - Within Douglas County, ranging from 72.0% in Southeast Omaha to 86.1% in Southwest Omaha.
- TREND: Denotes a statistically significant increase from previous survey findings.

**Have Had a Colorectal Cancer Screening (Among Adults Age 50-75)**

Healthy People 2020 Target = 70.5% or Higher

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

Incidence/Prevalence
- There appears to be a growing need of care for patients with cancer. – Physician, Douglas County
- High rates of pediatric cancer. Cancer is a leading cause of death among adults. – Social Services Provider, Douglas County
- Number-one killer. – Other Health Provider, Douglas County
- The incident of cancer in Omaha seems very high to me. – Community Leader, Douglas County
- Common cause of illness and death. – Community Leader, Douglas County
- Frequency I hear individuals struggling with cancer, dying of cancer. – Social Services Provider, Douglas County
- Information shared by the media and the dollars invested in research and treatment. – Social Services Provider, Douglas County
- I know so many people affected by cancer. It seems to be in every family. – Social Services Provider, Douglas County
- Many citizens are affected with these conditions which increases their utilization of health services. – Public Health Representative, Douglas County
- Cancer continues to impact the lives of more and more people of all ages in our community. Although the trend is moving in the right direction, it seems there is more we can do. – Social Services Provider, Douglas County
- This community built a cancer center. – Social Services Provider, Douglas County
- The number of deaths from cancer, particularly breast cancer. – Other Health Provider, Douglas County
- Because it's so rampant here they've built a cancer center. If they didn't feel they'd have the volume, they wouldn't have built it. Everyone from child to young adult, middle aged adult and the aged are being diagnosed. – Social Services Provider, Douglas County
- There are so many various type of cancers and due to my years of working in healthcare, seeing and dealing with cancer patients. – Social Services Provider, Douglas County
- There are so many different types of cancer that affect each and every demographic in devastating ways, such as financially, emotionally, spiritually and mentally. – Community Leader, Douglas County
- Cancer is major problem because there are so many different types, different reasons why a person may get cancer, genetics, exposures. Late diagnosis because of barriers resulting in late entry to care. For example, Every Woman Matters. – Community Leader, Douglas County
- Because of the many forms of cancer that are caused by preventive measures, there is a little known between certain cancers and the social determinants of health. – Social Services Provider, Douglas County
The increasing rate at which Douglas County residents are being diagnosed. Also, due to limited health insurance, low income people with cancer have trouble accessing treatment. – Social Services Provider, Douglas County

Access to Care/Services

No local accessibility for treatment or care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County

Since we do not know all the causes of cancer, it is harder to diagnosis and treat. We have amazing new facilities and think it will have an impact in the near future. – Community Leader, Douglas County

I believe a large number of individuals do not access care due to the cost of treatment. – Business Leader, Pottawattamie County

I think many patients miss cancer screening opportunities because of lack of access to care. – Advanced Practice Provider, Douglas County

I developed a theory called "I don't need no more bad news". Generally access to services is so poor that some segments of the community worry that if they are diagnosed with cancer, they won't be able to afford the care that might improve/prolong life. – Social Services Provider, Douglas County

Leading Cause of Death

Cancer is the leading cause of death among Douglas County residents. – Other Health Provider, Douglas County

Cancer is life threatening, thus it is a major problem. – First Responder, Douglas County

The death certificate, vital statistics indicate that cancer, in all its forms, continue to be a major concern for this community. – Public Health Representative, Douglas County

Health Awareness/Education

Lack of knowledge of ways how to get cancer, causes of cancer, ways to prevent cancer, advancements in cancer treatment, cancer support groups. – Social Services Provider, Douglas County

Awareness around risk factors for cancer among the community, outside of tobacco, is very low. Community and doctor-patient conversations need to focus more on addressing these links in order to build community support for environmental change and better. – Social Services Provider, Douglas County

Affordable Care/Services

Lower income population not having routine examinations. – Other Health Provider, Douglas County

Environmental Contributors

In the rural communities, I believe this is a problem due to the large number of pesticides and other harmful chemicals farmers have been using to treat cattle and crops. I also have seen a significant rise in the number of people who know someone. – Business Leader, Pottawattamie County

Health Disparities

The health disparities in cancer are the problem. Certain racial/ethnic backgrounds are more likely at risk. – Social Services Provider, Pottawattamie County

Prevention

Lack of person’s willingness to take advantage of preventative screenings and tests. – Community Leader, Douglas County

Tobacco Use

Tobacco use. – Community Leader, Douglas County
Respiratory Disease

About Asthma & COPD

Asthma and chronic obstructive pulmonary disease (COPD) are significant public health burdens. Specific methods of detection, intervention, and treatment exist that may reduce this burden and promote health.

Asthma is a chronic inflammatory disorder of the airways characterized by episodes of reversible breathing problems due to airway narrowing and obstruction. These episodes can range in severity from mild to life threatening. Symptoms of asthma include wheezing, coughing, chest tightness, and shortness of breath. Daily preventive treatment can prevent symptoms and attacks and enable individuals who have asthma to lead active lives.

COPD is a preventable and treatable disease characterized by airflow limitation that is not fully reversible. The airflow limitation is usually progressive and associated with an abnormal inflammatory response of the lung to noxious particles or gases (typically from exposure to cigarette smoke). Treatment can lessen symptoms and improve quality of life for those with COPD.

The burden of respiratory diseases affects individuals and their families, schools, workplaces, neighborhoods, cities, and states. Because of the cost to the healthcare system, the burden of respiratory diseases also falls on society; it is paid for with higher health insurance rates, lost productivity, and tax dollars. Annual healthcare expenditures for asthma alone are estimated at $20.7 billion.

Asthma. The prevalence of asthma has increased since 1980. However, deaths from asthma have decreased since the mid-1990s. The causes of asthma are an active area of research and involve both genetic and environmental factors.

Risk factors for asthma currently being investigated include:

- Having a parent with asthma
- Sensitization to irritants and allergens
- Respiratory infections in childhood
- Overweight

Asthma affects people of every race, sex, and age. However, significant disparities in asthma morbidity and mortality exist, in particular for low-income and minority populations. Populations with higher rates of asthma include: children; women (among adults) and boys (among children); African Americans; Puerto Ricans; people living in the Northeast United States; people living below the Federal poverty level; and employees with certain exposures in the workplace.

While there is not a cure for asthma yet, there are diagnoses and treatment guidelines that are aimed at ensuring that all people with asthma live full and active lives.

- Healthy People 2020 (www.healthypeople.gov)

[NOTE: COPD was changed to chronic lower respiratory disease (CLRD) with the introduction of ICD-10 codes. CLRD is used in vital statistics reporting, but COPD is still widely used and commonly found in surveillance reports.]
Age-Adjusted Respiratory Disease Deaths

Chronic Lower Respiratory Disease Deaths (CLRD)

Between 2014 and 2016, there was an annual average age-adjusted CLRD mortality rate of 52.5 deaths per 100,000 population in the Metro Area.

- Worse than Iowa and US rates; similar to the Nebraska rate.
- Unfavorably high in Cass and Pottawattamie counties.

The pneumonia/influenza mortality rate in the Metro Area is higher among Non-Hispanic Blacks than Whites.

Pneumonia/Influenza: Age-Adjusted Mortality by Race
(2014-2016 Annual Average Deaths per 100,000 Population)

- TREND: Mortality rates in the Metro Area have fallen and risen over the past decade, showing no persistent trend.

Pneumonia/Influenza: Age-Adjusted Mortality Trends
(Annual Average Deaths per 100,000 Population)
Asthma

A total of 9.3% of Metro Area adults report having asthma.

- Similar to the Nebraska and US proportions, but higher than the Iowa proportion.
- Unfavorably high in Pottawattamie County.
  - Within Douglas County, particularly high (15.1%) in Northeast Omaha.
- TREND: The prevalence of adults with current asthma has not changed significantly since 2011.

**Adult Asthma: Current Prevalence**

Survey respondents were asked to indicate whether they suffer from or have been diagnosed with various respiratory conditions, including asthma and COPD.

TREND: The prevalence of Douglas County and Sarpy/Cass County adults with current asthma has not changed significantly over time.
The following adults are more likely to suffer from asthma:

- Women.
- Younger residents (negative correlation with age).
- Residents in the lowest-income households.
- Black residents.

**Currently Have Asthma**
(Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 312]
Notes: 
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Chronic Obstructive Pulmonary Disease (COPD)

A total of 9.1% of Metro Area adults suffer from chronic obstructive pulmonary disease (COPD), including emphysema and bronchitis.

- Worse than the state proportions, but similar to the US.
- Unfavorably high in Pottawattamie County.
  - Favorably low in Northwest Omaha.
- TREND: Note the statistically significant increase over time.
  - NOTE: In 2011, this question was asked slightly differently; respondents in 2011 were asked if they had ever been diagnosed with “chronic lung disease, including bronchitis or emphysema,” rather than “COPD or chronic obstructive pulmonary disease, including bronchitis or emphysema,” as is asked currently.

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

Environmental Contributors

- Long history of business connected pollution that causes a much higher than average incidence of asthma in North Omaha. Usage and second-hand smoke due to smoking. Lead paint, lead in the soil that negatively affects breathing. – Social Services Provider, Douglas County
- Because of airborne elements. – Social Services Provider, Douglas County
- There are issues with asthma in the community. Mold and other environmental pollutants indoors. – Social Services Provider, Douglas County
Once again, I think of the farming communities and the products, ammonia, fertilizers that are released into the air. I also am hearing of more and more asthma, sinus and upper respiratory illnesses, diagnoses. – Business Leader, Pottawattamie County

Incidences/Prevalence

Asthma, allergies and sinus problems are substantial diagnoses throughout the community. – Social Services Provider, Douglas County

The asthma diagnosis in this community is off the charts. If I’m not mistaken, it’s number one. – Social Services Provider, Douglas County

Interstitial Lung Disease, this includes asthma, COPD, bronchitis and allergies. This is different from lung cancer. – Social Services Provider, Douglas County

Leading Cause of Death

This is a leading cause of adult death in Douglas County and is disproportionately impacting older neighborhoods with older housing stock, near industry and subject to smoking allowed in multi-unit structures. – Other Health Provider, Douglas County

Among the top five killers. – Other Health Provider, Douglas County

Access to Care/Services

No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County

Poverty

Asthma is tied to poverty. – Social Services Provider, Douglas County

Tobacco Use

High rate of smoking and pollutants in the air. – Community Leader, Douglas County
Injury & Violence

About Injury & Violence

Injuries and violence are widespread in society. Both unintentional injuries and those caused by acts of violence are among the top 15 killers for Americans of all ages. Many people accept them as “accidents,” “acts of fate,” or as “part of life.” However, most events resulting in injury, disability, or death are predictable and preventable.

Injuries are the leading cause of death for Americans ages 1 to 44, and a leading cause of disability for all ages, regardless of sex, race/ethnicity, or socioeconomic status. More than 180,000 people die from injuries each year, and approximately 1 in 10 sustains a nonfatal injury serious enough to be treated in a hospital emergency department.

Beyond their immediate health consequences, injuries and violence have a significant impact on the well-being of Americans by contributing to:

- Premature death
- Disability
- Poor mental health
- High medical costs
- Lost productivity

The effects of injuries and violence extend beyond the injured person or victim of violence to family members, friends, coworkers, employers, and communities.

Numerous factors can affect the risk of unintentional injury and violence, including individual behaviors, physical environment, access to health services (ranging from pre-hospital and acute care to rehabilitation), and social environment (from parental monitoring and supervision of youth to peer group associations, neighborhoods, and communities).

Interventions addressing these social and physical factors have the potential to prevent unintentional injuries and violence. Efforts to prevent unintentional injury may focus on:

- Modifications of the environment
- Improvements in product safety
- Legislation and enforcement
- Education and behavior change
- Technology and engineering

Efforts to prevent violence may focus on:

- Changing social norms about the acceptability of violence
- Improving problem-solving skills (for example, parenting, conflict resolution, coping)
- Changing policies to address the social and economic conditions that often give rise to violence

Healthy People 2020 (www.healthypeople.gov)

Leading Causes of Accidental Death

Falls, motor vehicle accidents, and poisoning (including accidental drug overdose) accounted for most accidental deaths in the Metro Area between 2014 and 2016.
Leading Causes of Accidental Death
(Metro Area, 2014-2016)

- Falls 28.4%
- Motor Vehicle Accidents 26.7%
- Poisoning/Noxious Substances 23.6%
- Other 21.4%

Sources: CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted March 2018.

Notes: Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).

Unintentional Injury

Age-Adjusted Unintentional Injury Deaths
Between 2014 and 2016, there was an annual average age-adjusted unintentional injury mortality rate of 35.5 deaths per 100,000 population in the Metro Area.

- More favorable than the state and US rates.
- Similar to the Healthy People 2020 target (36.4 or lower).
- Unfavorably high in Cass and Pottawattamie counties.

Unintentional Injuries: Age-Adjusted Mortality
(2014-2016 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 36.4 or Lower

- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.

**TREND:** Despite fluctuations, there is an overall upward trend in the unintentional injury mortality rate in the Metro Area, echoing the rising trends reported in Nebraska, Iowa, and the US overall.
Age-Adjusted Motor Vehicle Crash Deaths

Between 2014 and 2016, there was an annual average age-adjusted motor vehicle accident mortality rate of 9.5 deaths per 100,000 population in the Metro Area.

- More favorable than the state and US rates.
- Satisfies the Healthy People 2020 target (12.4 or lower).
- Considerably high in Pottawattamie County.

*(Douglas County, 2016)*  
**Healthy People 2020 Target = 92.4% or Higher**

Falls

Each year, an estimated one-third of older adults fall, and the likelihood of falling increases substantially with advancing age. In 2005, a total of 15,802 persons age ≥65 years died as a result of injuries from falls.

Falls are the leading cause of fatal and nonfatal injuries for persons aged ≥65 years … In 2006, approximately 1.8 million persons aged ≥65 years (nearly 5% of all persons in that age group) sustained some type of recent fall-related injury. Even when those injuries are minor, they can seriously affect older adults’ quality of life by inducing a fear of falling, which can lead to self-imposed activity restrictions, social isolation, and depression.

In addition, fall-related medical treatment places a burden on US healthcare services. In 2000, direct medical costs for fall-related injuries totaled approximately $19 billion. A recent study determined that 31.8% of older adults who sustained a fall-related injury required help with activities of daily living as a result, and among them, 58.5% were expected to require help for at least 6 months.

Modifiable fall risk factors include muscle weakness, gait and balance problems, poor vision, use of psychoactive medications, and home hazards. Falls among older adults can be reduced through evidence-based fall-prevention programs that address these modifiable risk factors. Most effective interventions focus on exercise, alone or as part of a multifaceted approach that includes medication management, vision correction, and home modifications.

- Division of Unintentional Injury Prevention, National Center for Injury Prevention and Control, CDC
Between 2014 and 2016, there was an annual average age-adjusted fall-related mortality rate of 70.7 deaths (age 65+) per 100,000 population in the Metro Area.

- Less favorable than the Nebraska and US rates, but more favorable than the Iowa rate.
- Unfavorably high in Pottawattamie County (echoing the higher Iowa rate).

Notes: Asked of all respondents age 45+. 
The prevalence is similar to the national proportion.

Similar findings by county.
  - Within Douglas County, the proportion is considerably higher in Northeast Omaha.

Among those who fell in the past year, 35.4% were injured as a result of the fall.

**Fell One or More Times in the Past Year**
(Among Respondents Age 45 and Older)

These population groups were more likely to have fallen in the past year:

- Seniors (age 65+).
- Low-income residents (negative correlation with income).
- Black and Hispanic residents.

**Fell One or More Times in the Past Year**
(Among Respondents Age 45 and Older; Metro Area, 2018)
Firearm Safety

Age-Adjusted Firearm-Related Deaths

Between 2014 and 2016, firearms in the Metro Area contributed to an annual average age-adjusted rate of 10.2 deaths per 100,000 population.

- Higher than found in Nebraska and Iowa, but lower than the US rate.
- Fails to satisfy the Healthy People 2020 objective (9.3 or lower).
- Higher in Douglas and Pottawattamie counties.

Firearms-Related Deaths: Age-Adjusted Mortality
(2014-2016 Annual Average Deaths per 100,000 Population)

Healthy People 2020 Target = 9.3 or Lower

Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.

- Firearms-related mortality is nearly four times higher in the Metro Area’s Black population when compared with White residents.
Firearms-Related Deaths: Age-Adjusted Mortality by Race
(2014-2016 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 9.3 or Lower

TREND: Note the increasing trend in firearms-related mortality over time in the Metro Area, echoing the increasing trends reported across Nebraska, Iowa, and the US overall.

Firearms-Related Deaths: Age-Adjusted Mortality Trends
(Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 9.3 or Lower

- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
Presence of Firearms in Homes

Overall, more than one-third (36.4%) of Metro Area adults has a firearm kept in or around their home.

- Higher than the national prevalence.
- Much lower in Douglas County than the remainder of the Metro Area.
  - Ranging considerably within Douglas County (highest in Western Douglas).
- Among Metro Area households with children, 36.4% have a firearm kept in or around the house (comparable to that reported nationally).
- TREND: Similar to the 2011 survey findings, but marking a statistically significant increase from 2015.

Have a Firearm Kept in or Around the Home

Survey respondents were asked about the presence of weapons in the home:

"Are there any firearms now kept in or around your home, including those kept in a garage, outdoor storage area, truck, or car? For the purposes of this inquiry, ‘firearms’ include pistols, shotguns, rifles, and other types of guns, but do NOT include starter pistols, BB guns, or guns that cannot fire."

Violent Crime

Violent Crime Rates

Between 2012 and 2014, there were a reported 410.4 violent crimes per 100,000 population in the Metro Area.

- Much higher in Douglas and especially Pottawattamie counties when compared with Sarpy and Cass counties.
- Higher than the state and US rates for the same time period.

Sources:
- This indicator reports the rate of violent crime offenses reported by the sheriff’s office or county police department per 100,000 residents. Violent crime includes homicide, rape, robbery, and aggravated assault. This indicator is relevant because it assesses community safety.
- Participation by law enforcement agencies in the UCR program is voluntary. Sub-state data do not necessarily represent an exhaustive list of crimes due to gaps in reporting. Also, some institutions of higher education have their own police departments, which handle offenses occurring within campus grounds; these offenses are not included in the violent crime statistics, but can be obtained from the Uniform Crime Reports Universities and Colleges data tables.
**Community Violence**

A total of 1.3% of surveyed Metro Area adults acknowledge being the victim of a violent crime in the area in the past five years.

- Well below the national findings.
- None reported in Cass County.
  - Similar findings by community in Douglas County.
- **TREND:** Marks a statistically significant decrease from previous survey results.

**Victim of a Violent Crime in the Past Five Years**

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 46]
Notes: Asked of all respondents.
• Reports of violence are notably higher among residents living in the lower income categories.

**Intimate Partner Violence — Physical**

A total of 13.4% of Metro Area adults acknowledge that they have ever been hit, slapped, pushed, kicked, or otherwise hurt by an intimate partner.

• Comparable to national findings.

• Similar findings by county.
  * Unfavorably high in Northeast Omaha.

• TREND: The prevalence is statistically unchanged over time.
COMMUNITY HEALTH NEEDS ASSESSMENT

Have Ever Been Hit, Slapped, Pushed, Kicked, or Hurt in Any Way by an Intimate Partner

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 47]
2017 PRC National Health Survey, Professional Research Consultants, Inc.
Notes: Asked of all respondents.

- TREND: Over time, intimate partner violence has increased significantly in Douglas County as well as Sarpy/Cass counties.

Have Experienced Domestic Violence in the Past 5 Years

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 361]
Notes: Asked of all respondents.

Reports of domestic violence are also notably higher among:

- Women.
- Adults under 65 (negative correlation with age).
- Residents in the lowest income category.
Across the Metro Area, note that 4.0% of the Metro Area population sample acknowledged being victims of intimate partner violence within the past 5 years.

**Intimate Partner Violence — Emotional**

*Asked whether an intimate partner has been controlling, degrading, harassing, or disruptively jealous in the past 5 years, 4.1% of survey respondents answered affirmatively.*

- Favorably low in Cass County.
  - Statistically similar findings by community in Douglas County.
- **TREND:** Denotes a statistically significant decrease from 2011 survey findings.
Key Informant Input: Injury & Violence

The largest share of key informants taking part in an online survey characterized Injury & Violence as a “major problem” in the community.

**Perceptions of Injury & Violence as a Problem in the Community**
(Key Informants, 2018)

- **Major Problem**: 45.1%
- **Moderate Problem**: 32.4%
- **Minor Problem**: 16.9%
- **No Problem At All**: 5.6%

**Sources:** PRC Online Key Informant Survey, March 2018.

**Top Concerns**

Among those rating this issue as a “major problem,” reasons related to the following:

**Incidence/Prevalence**

As our country becomes more agitated, anger as a first response is seemingly on the rise. From an increase in road-rage incidents to greater numbers of reported child, spouse, partner abuse, battering continues to grow as a way to express anger. – Business Leader, Pottawattamie County

We rank as one of the most dangerous cities per capita in the nation. – Social Services Provider, Douglas County

Data. – Public Health Representative, Douglas County

Based on the neighborhood a person, family lives in, threat of violence is a daily occurrence. Keeps people from being able to think about their physical activity or eating right because they’re more concerned about their safety or that of their child. – Social Services Provider, Douglas County

Biggest killer among young people. – Other Health Provider, Douglas County
Due to local news reports and shooting that occur nightly, gangs, thefts and such. – Social Services Provider, Douglas County

Communities allow criminals to reside in residences. Families tolerate criminal behavior. The prison industrial complex provides jobs in rural communities. – Social Services Provider, Douglas County

We continue to see, hear that people don’t feel safe in their neighborhoods and children living in homes where they are witnessing and, or experiencing violence themselves. With our limited mental health services available makes it difficult for children. – Community Leader, Douglas County

Crime rate. – Other Health Provider, Douglas County

It’s probably televised more than necessary. I’d rather there be none. – Social Services Provider, Douglas County

It feels like we continue to see an increase in violence in certain part of our cities but also throughout. Whether it is gang violence, robbery and burglary. It is hard to know if it is a true increase or appears this way due to media. – Social Services Provider, Douglas County

Violence in our African American is in the media very frequently. – Public Health Representative, Douglas County

Violence and injury occurs all over the city, not just the socioeconomically disadvantaged locales. – Social Services Provider, Douglas County

Violence and injuries are at the top of every news hour in our community. – Social Services Provider, Douglas County

Violence impacts thousands of families and communities each year. Domestic violence is far too common and under-reported. – Social Services Provider, Douglas County

Gang violence and related direct and indirect trauma in communities. Domestic violence and related trauma. – Community Leader, Douglas County

Injury is an important cause of death for children, violence in the home is pervasive. Community safety is an issue in parts of Omaha. – Social Services Provider, Douglas County

**Gun Violence**

Ongoing gun violence and domestic abuse continue to be an issue in areas of the county. – Other Health Provider, Douglas County

Too many deaths and injuries in our community especially in the youth. Gun violence is especially high here, but efforts to decrease them seem to be helping. – Public Health Representative, Douglas County

Robberies, shootings, gang violence. More attention needs to be paid to this arena. – Other Health Provider, Douglas County

We still have a lot of gun violence here. – Social Services Provider, Douglas County

The easy access to weapons, particularly fire arms. – Community Leader, Douglas County

Regular shootings in Omaha. – Social Services Provider, Douglas County

Shootings, homicides, domestic violence, accidental deaths due to drugs, alcohol. – Social Services Provider, Douglas County

Accidental gun deaths and injuries due to easy access to firearms. – Social Services Provider, Douglas County

Gun related injuries. – Social Services Provider, Douglas County

The number of gang related shootings. – Social Services Provider, Douglas County

**Domestic/Child Abuse**

One in four women are victims of violence. Victims living in poverty are over represented. The amount of injuries that have not been treated through medical practitioners is staggering. – Social Services Provider, Douglas County

Domestic violence and sexual assault. – Other Health Provider, Douglas County

Rate of trauma seen in children and mental health clients based on level of violence in their neighborhoods and homes. Children are no longer allowed, nor is it safe, for them to play outside in many neighborhoods of our community. – Social Services Provider, Douglas County

Child abuse and domestic violence are at staggering numbers. – Social Services Provider, Douglas County

**Accidents**

Motor vehicle crashes are a leading cause of death and policies are not up to par to prevent. In addition,
drinking and driving continues to be a major problem in our community. Violence is a public health epidemic, while there have been major strides. – Other Health Provider, Douglas County

The significant number of emergency room visits for accident-related injuries as well as weapon-related injuries. – Other Health Provider, Douglas County

Adverse Childhood Experiences

Violence is deemed as a health condition. Many adolescences and young adults have untreated violent health conditions that generally stem from childhood experiences, acceptable violent norms, post/current traumatic events. – Social Services Provider, Douglas County

ACES, Adverse Childhood Experience impact individual health, physical and mental health. When it occurs, but also the long-term health status of the individual. – Social Services Provider, Douglas County

Access to Care/Services

No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County

Lack of access to resources, education. Mental health issues and addiction. – Social Services Provider, Douglas County

Contributing Factors

Social determinants of health, poverty, lack of education, unemployment, under employment. – Advanced Practice Provider, Douglas County

Alcohol/Drug Use

There are crime issues in CB. Much is related to substance use. – Social Services Provider, Pottawattamie County

Health Awareness/Education

Lack of education and prevention work. – Other Health Provider, Pottawattamie County

Youth Violence

Youth violence still too high. – Community Leader, Douglas County
Diabetes

About Diabetes

Diabetes mellitus occurs when the body cannot produce or respond appropriately to insulin. Insulin is a hormone that the body needs to absorb and use glucose (sugar) as fuel for the body’s cells. Without a properly functioning insulin signaling system, blood glucose levels become elevated and other metabolic abnormalities occur, leading to the development of serious, disabling complications. Many forms of diabetes exist; the three common types are Type 1, Type 2, and gestational diabetes. Effective therapy can prevent or delay diabetic complications.

Diabetes mellitus:
- Lowers life expectancy by up to 15 years.
- Increases the risk of heart disease by 2 to 4 times.
- Is the leading cause of kidney failure, lower limb amputations, and adult-onset blindness.

The rate of diabetes mellitus continues to increase both in the United States and throughout the world. Due to the steady rise in the number of persons with diabetes mellitus, and possibly earlier onset of type 2 diabetes mellitus, there is growing concern about the possibility that the increase in the number of persons with diabetes mellitus and the complexity of their care might overwhelm existing healthcare systems.

People from minority populations are more frequently affected by type 2 diabetes. Minority groups constitute 25% of all adult patients with diabetes in the US and represent the majority of children and adolescents with type 2 diabetes.

Lifestyle change has been proven effective in preventing or delaying the onset of type 2 diabetes in high-risk individuals.
- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Diabetes Deaths

Between 2014 and 2016, there was an annual average age-adjusted diabetes mortality rate of 22.8 deaths per 100,000 population in the Metro Area.
- Better than the Iowa rate and similar to the Nebraska rate.
- Worse than the US rate.
- Fails to satisfy the Healthy People 2020 target (20.5 or lower, adjusted to account for diabetes mellitus-coded deaths).
- Unfavorably high in Douglas and Pottawattamie counties.

**Prevalence of Diabetes**
A total of 11.2% of Metro Area adults report having been diagnosed with diabetes.

- Worse than the statewide proportions, but similar to the US figure.
- Similar findings by county.
  - Unfavorably high in Northeast Omaha.
- TREND: Statistically unchanged since 2011.

In addition to the prevalence of diagnosed diabetes referenced above, another 7.7% of Metro Area adults report that they have “pre-diabetes” or “borderline diabetes.”

- Comparable to the US prevalence.
- Similar findings by county and within Douglas County (not shown).
Prevalence of Diabetes

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

Health Awareness/Education

- Identifying the risk of prediabetes, screening for prediabetes and following up with a diabetes prevention program. – Public Health Representative, Douglas County
- Getting diabetic education. – Social Services Provider, Douglas County
- Awareness of risk. Proactive recognition. Doctor visits and recognition of the problem. – Community Leader, Douglas County
- Understanding a diabetes diagnosis. Don’t know what or how to eat to mitigate worst effects of the disease, lack of access to medications, and effective community education. – Social Services Provider, Douglas County
- Lack of education and awareness about dietary and lifestyle options that will reduce reliance on medications and issues related to poor management. – Social Services Provider, Douglas County
Access to diabetic education and supplies and cost of medication to manage diabetes. – Social Services Provider, Douglas County

Understanding the need to know their numbers and, if at risk or diagnosed, receive the education and understanding that lifestyle change is necessary to manage the diagnosis. – Social Services Provider, Douglas County

Many with pre-diabetes are not even aware of it. Personal healthy lifestyle changes can make a huge difference, but need culture change and affordable and available healthy foods for those in poverty. Healthcare steps, medications and technology. – Public Health Representative, Douglas County

Lack of education on how to control their condition, lack of resources to do so, and lack of interest in helping themselves. – Public Health Representative, Pottawattamie County

No education or prevention work. – Other Health Provider, Pottawattamie County

Nutrition, Physical Activity & Weight

Access to healthy, affordable food. Cost of medications. – Other Health Provider, Douglas County

Access to healthy food. Ability to purchase healthy food. Lack of physical care of their diabetes due to mental health issues. Lack of priority in our schools on physical education and health education. – Social Services Provider, Douglas County

Continued obesity, poor diet, lack of exercise. – Physician, Pottawattamie County

Losing weight and ability or motivation to maintain appropriate exercise routines. Proper diet. – Community Leader, Douglas County

Due to the continued decline of physical activity and healthy eating habits obesity and diabetes continue to become larger health issues in our community. We need more access to information, nutrition education, care, and healthy foods. – Social Services Provider, Douglas County

I believe the greatest challenges in this area are the need for explanations of dietary contributions to diabetes, in understandable language. I think this is compounded by the lack of tasty and affordable alternatives to address the need. – Social Services Provider, Douglas County

Diet and lack of exercise. – Community Leader, Douglas County

Access to dietitians as well as lack of proper nutrition. – Community Leader, Douglas County

Nutrition and lack of exercise. – Social Services Provider, Douglas County

Diet, exercise, compliance, and medication availability. – Social Services Provider, Douglas County

Incidence/Prevalence

Large disease burden, poor understanding of outcomes for patients, poor control of many. Many pre-diabetics with poor understanding. – Business Leader, Douglas County

There is an estimated 30% of the population that is prediabetic or diabetic and unaware and thus the disease is taking its toll on their organs, eyes and foot health. – Other Health Provider, Douglas County

It's a serious, largely preventable disease that alters the course of people's lives and costs a lot of money to treat. – Social Services Provider, Douglas County

It seems that in this area Type II diabetes is on the rise. Many people I know have been diagnosed as prediabetic. Lowering A1C has now become a topic of conversation at social gatherings. This isn't something I have witnessed in the recent past. – Business Leader, Pottawattamie County

Increasing among young people and an ongoing problem with people of all ages. – Other Health Provider, Douglas County

A majority of patients seen in various clinics, emergency departments and admissions have diabetes. – Other Health Provider, Douglas County

As a first responder, emergency response to diabetic emergencies is common. – First Responder, Douglas County

Access to Care/Services

Lack of equal care for all. The low income suffer from diabetes because of food insecurity. – Social Services Provider, Douglas County

No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County

Access to regular medical care, healthy food choices, and physical fitness facilities that are usable year round. – Community Leader, Cass County
Access to healthcare is hard and healthy foods and how to cook them, are not accessible. Safety is an issue for exercise, diabetes will remain an issue. – Social Services Provider, Douglas County
Access to care, medications and supplies to manage diabetes. Also, medication adherence is a concern, mostly due to cost. – Advanced Practice Provider, Douglas County

Health Disparities
Diabetes is a challenge across racial or ethnic groups. We are not doing a good enough job helping people to successfully self-manage their conditions. We also need to do a better job at education and prevention of diabetes. – Community Leader, Douglas County
The disparities are the challenge. Certain racial/ethnic groups are at greater risk. – Social Services Provider, Pottawattamie County
Lower income have lack of income to eat healthy and high percentage of obesity. – Other Health Provider, Douglas County
Poverty, diet, transportation, learning and disease maintenance. – Social Services Provider, Douglas County
The challenge is to prevent diabetes, especially among African Americans and Native Americans. – Social Services Provider, Douglas County

Access to Medication/Supplies
Access to testing strips and diet counseling. – Other Health Provider, Douglas County
Access to medications, information in plain language about the disease, health professionals trained as both diabetic educators and motivational interviewers. – Other Health Provider, Pottawattamie County
Access medical supplies and ongoing monitoring. – Business Leader, Pottawattamie County
Access to blood glucose monitoring and diabetic education. – Social Services Provider, Douglas County

Disease Management Challenges
Not consistently monitoring their condition and ensuring they are eating healthy. – Social Services Provider, Douglas County
Challenges with managing the disease, rate of obesity, aging population. – Social Services Provider, Douglas County
Noncompliance with diabetic treatment protocol, diet, medications. – Social Services Provider, Douglas County
Compliance with medications, ability to pay for doctor's visits and buy their medications. – Physician, Douglas County

Affordable Care/Services
We have significant disparities in diabetes and need to continue work on the determinants of health that drive someone's ability to prevent diabetes and take care of themselves if they are at risk or diagnosed. – Other Health Provider, Douglas County

Prevention
Prevention, then management strategies. – Social Services Provider, Douglas County

Contributing Factors
Transportation. Education. Affordable care. Access to doctors. – Social Services Provider, Douglas County

Cultural Barriers
Culturally specific prevention programs. – Social Services Provider, Douglas County

Lifestyle
Behavior change needed to optimize health. – Social Services Provider, Douglas County
Alzheimer’s Disease

About Dementia

Dementia is the loss of cognitive functioning—thinking, remembering, and reasoning—to such an extent that it interferes with a person’s daily life. Dementia is not a disease itself, but rather a set of symptoms. Memory loss is a common symptom of dementia, although memory loss by itself does not mean a person has dementia. Alzheimer’s disease is the most common cause of dementia, accounting for the majority of all diagnosed cases.

Alzheimer’s disease is the 6th leading cause of death among adults age 18 years and older. Estimates vary, but experts suggest that up to 5.1 million Americans age 65 years and older have Alzheimer’s disease. These numbers are predicted to more than double by 2050 unless more effective ways to treat and prevent Alzheimer’s disease are found.

Age-Adjusted Alzheimer’s Disease Deaths

Between 2014 and 2016, there was an annual average age-adjusted Alzheimer’s disease mortality rate of 32.3 deaths per 100,000 population in the Metro Area.

- Worse than the statewide and US rates.
- Notably high in Pottawattamie County.

• Trend: The Alzheimer’s disease mortality rate has increased over time in the Metro Area.

### Alzheimer’s Disease: Age-Adjusted Mortality Trends
(Annual Average Deaths per 100,000 Population)
Progressive Confusion/Memory Loss

A total of 9.0% of adults age 45 and older report experiencing confusion or memory loss in the past year that is happening more often or getting worse.

- Comparable to the US prevalence.
- Similar findings by county.
  - Highest in Northeast Omaha; lowest in Western Douglas County.

Experienced Increasing Confusion/Memory Loss in Past Year
(Among Respondents Age 45 and Older)

A higher prevalence of progressive confusion/memory loss is reported among:

- Women.
- Seniors.
- Low-income residents (negative correlation with income).
- Black residents.
- Hispanics.

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

Aging Population

Our community is an older one with an increase projected for aging members. We lack sufficient resources for individuals with dementia, Alzheimer’s, including adult day programs, trained community support, and support for caregivers. – Business Leader, Pottawattamie County
Because of our aging population and lack of community education on this issue. – Social Services Provider, Douglas County
Aging baby boomers. Anecdotally more families talk about it affecting their loved ones. – Social Services Provider, Douglas County
A lot of elderly are affected with this. – Social Services Provider, Douglas County
As people live longer, the chance of demonstrating this disease grows. Medical treatment is probably as good as it can be but day-to-day help and assistance is very limited. – Social Services Provider, Douglas County

The significant increase in the elderly population and specifically those over 75 years of age. – Social Services Provider, Douglas County

Aging population. – Community Leader, Douglas County

Incidence/Prevalence

I personally know many people who are struggling with either issue. – Social Services Provider, Pottawattamie County

Refer to recent caregiver research by UNMC, UNO, and other national studies on the prevalence of dementia, AD, as well as changes in our life expectancy. – Other Health Provider, Douglas County

More people are being diagnosed at earlier stages of life. – Social Services Provider, Douglas County

Health Disparities

There are very limited resources available for dementia and Alzheimer's care in the Latino community. Latinos are at higher risk than other groups and the number of cases is expected to increase exponentially over the coming years. – Community Leader, Douglas County

Alzheimer's/dementia is a massive undiagnosed problem among marginalized populations. It often kills the caregiver. Existing care, especially for caregivers, is limited to the rich. This area of care when looked into is extremely desperate. – Social Services Provider, Douglas County

Impact on Families/Caregivers

Large burden, few resources for both caregivers and patients. – Business Leader, Douglas County

Lack of residential care and support for caretakers. – Social Services Provider, Douglas County

This disease is emotionally painful for families. Creates caregiving challenges which if families are seeking care, are limited and expensive. – Public Health Representative, Douglas County

Lack of Inpatient Facilities

This is a growing issue, housing is limited and very expensive. – Social Services Provider, Douglas County

The number of dementia/Alzheimer's patients and the lack of beds for such patients in long-term care facilities. – Other Health Provider, Douglas County

Diagnosis/Treatment

There are some many identified cases. – Community Leader, Douglas County

Lack of effective treatment to date. – Social Services Provider, Douglas County

Affordable Care/Services

Because many seniors have limited income and uninvolved or no family members that would allow them to be cared for in home or in a facility that they can afford with caring staff and support. – Social Services Provider, Douglas County

Access to Care/Services

No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County

Environmental Contributors

It must be associated with the environment. – Social Services Provider, Douglas County
COMMUNITY HEALTH NEEDS ASSESSMENT

Kidney Disease

About Kidney Disease

Chronic kidney disease and end-stage renal disease are significant public health problems in the United States and a major source of suffering and poor quality of life for those afflicted. They are responsible for premature death and exact a high economic price from both the private and public sectors. Nearly 25% of the Medicare budget is used to treat people with chronic kidney disease and end-stage renal disease.

Genetic determinants have a large influence on the development and progression of chronic kidney disease. It is not possible to alter a person’s biology and genetic determinants; however, environmental influences and individual behaviors also have a significant influence on the development and progression of chronic kidney disease. As a result, some populations are disproportionately affected. Successful behavior modification is expected to have a positive influence on the disease.

Diabetes is the most common cause of kidney failure. The results of the Diabetes Prevention Program (DPP) funded by the National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK) show that moderate exercise, a healthier diet, and weight reduction can prevent development of type 2 diabetes in persons at risk.

- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Kidney Disease Deaths

Between 2014 and 2016, there was an annual average age-adjusted kidney disease mortality rate of 11.1 deaths per 100,000 population in the Metro Area.

- Similar to the Nebraska rate, but higher than the Iowa rate.
- Better than the US rate.
- Highest in Pottawattamie County.

### Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

**Prevalence of Diabetes**

- It is a result of the high rate of diabetes in the community. – Community Leader, Douglas County
- Secondary to uncontrolled diabetes. – Other Health Provider, Douglas County
- Diabetes is a growing problem due to sedentary lifestyles and proper dietary choices. – Community Leader, Douglas County

**Incidence/Prevalence**

- As a first responder, chronic kidney disease is frequently encountered. – First Responder, Douglas County
- The sheer number of residents on dialysis. – Other Health Provider, Douglas County

**Access to Care/Services**

- No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County

**Alcohol/Drug Use**

- Substance, alcohol abuse. – Community Leader, Douglas County

**Diet/Nutrition**

- Poor nutrition and diet has led to this in Omaha. – Social Services Provider, Douglas County

**Health Awareness/Education**

- It is poorly understood how many are at risk. The number of diabetics at risk who have chronic kidney disease already and don’t know. The number who have it and have not been told by their doctors, the number who mistreat and misunderstand things. – Business Leader, Douglas County

**Prevention**

- Because patients are not getting preventative care like blood pressure checks, screenings for diabetes, and weight management. – Advanced Practice Provider, Douglas County
Potentially Disabling Conditions

Chronic Pain

About Arthritis, Osteoporosis, & Chronic Back Conditions

There are more than 100 types of arthritis. Arthritis commonly occurs with other chronic conditions, such as diabetes, heart disease, and obesity. Interventions to treat the pain and reduce the functional limitations from arthritis are important, and may also enable people with these other chronic conditions to be more physically active. Arthritis affects 1 in 5 adults and continues to be the most common cause of disability. It costs more than $128 billion per year. All of the human and economic costs are projected to increase over time as the population ages. There are interventions that can reduce arthritis pain and functional limitations, but they remain underused. These include: increased physical activity; self-management education; and weight loss among overweight/obese adults.

Osteoporosis is a disease marked by reduced bone strength leading to an increased risk of fractures (broken bones). In the United States, an estimated 5.3 million people age 50 years and older have osteoporosis. Most of these people are women, but about 0.8 million are men. Just over 34 million more people, including 12 million men, have low bone mass, which puts them at increased risk for developing osteoporosis. Half of all women and as many as 1 in 4 men age 50 years and older will have an osteoporosis-related fracture in their lifetime.

Chronic back pain is common, costly, and potentially disabling. About 80% of Americans experience low back pain in their lifetime. It is estimated that each year:

- 15%-20% of the population develop protracted back pain.
- 2-8% have chronic back pain (pain that lasts more than 3 months).
- 3-4% of the population is temporarily disabled due to back pain.
- 1% of the working-age population is disabled completely and permanently as a result of low back pain.

Americans spend at least $50 billion each year on low back pain. Low back pain is the:

- 2nd leading cause of lost work time (after the common cold).
- 3rd most common reason to undergo a surgical procedure.
- 5th most frequent cause of hospitalization.

Arthritis, osteoporosis, and chronic back conditions all have major effects on quality of life, the ability to work, and basic activities of daily living.

- Healthy People 2020 (www.healthypeople.gov)

Nearly 3 in 10 Metro Area adults (29.4%) report suffering from some type of chronic pain.

- Favorably lower in Cass County.
  - Similar findings by community within Douglas County.

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

Access to Care/Services
- Lack of access to medical facilities. – Community Leader, Douglas County
- No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County
- Lack of access to preventive care. – Social Services Provider, Douglas County

Aging Population
- Aging population. – Other Health Provider, Douglas County
- Community aging. – Community Leader, Douglas County
Affordable Care/Services

Hearing/vision costs for care are now carved out of many health insurance plans, so they are out of pocket or separate insurance items to purchase. The level of vision and hearing affects quality of life. Many more individuals now having hearing loss. – Public Health Representative, Douglas County
Infectious Disease
Influenza & Pneumonia Vaccination

About Influenza & Pneumonia

Acute respiratory infections, including pneumonia and influenza, are the 8th leading cause of death in the nation, accounting for 56,000 deaths annually. Pneumonia mortality in children fell by 97% in the last century, but respiratory infectious diseases continue to be leading causes of pediatric hospitalization and outpatient visits in the US. On average, influenza leads to more than 200,000 hospitalizations and 36,000 deaths each year. The 2009 H1N1 influenza pandemic caused an estimated 270,000 hospitalizations and 12,270 deaths (1,270 of which were of people younger than age 18) between April 2009 and March 2010.

- Healthy People 2020 (www.healthypeople.gov)

Flu Vaccination (Douglas County Only)

According to the CDC 2016 BRFSS data for Douglas County, 69.6% of county seniors had a flu shot within the past year.

- TREND: Statistically unchanged since 2002.

Sources:

Notes:
- Reflects respondents 65 and older.
- Includes FluMist as a form of vaccination.
Pneumonia Vaccination (Douglas County Only)

2016 BRFSS data reveal that 79.3% of Douglas County seniors have had a pneumonia vaccine.

- TREND: Statistically unchanged since 2008.

Have Ever Had a Pneumonia Vaccine

HIV

About Human Immunodeficiency Virus (HIV)

The HIV epidemic in the United States continues to be a major public health crisis. An estimated 1.1 million Americans are living with HIV, and 1 in 5 people with HIV do not know they have it. HIV continues to spread, leading to about 56,000 new HIV infections each year.

HIV is a preventable disease, and effective HIV prevention interventions have been proven to reduce HIV transmission. People who get tested for HIV and learn that they are infected can make significant behavior changes to improve their health and reduce the risk of transmitting HIV to their sex or drug-using partners. More than 50% of new HIV infections occur as a result of the 21% of people who have HIV but do not know it.

In the era of increasingly effective treatments for HIV, people with HIV are living longer, healthier, and more productive lives. Deaths from HIV infection have greatly declined in the United States since the 1990s. As the number of people living with HIV grows, it will be more important than ever to increase national HIV prevention and healthcare programs.

There are gender, race, and ethnicity disparities in new HIV infections:

- Nearly 75% of new HIV infections occur in men.
- More than half occur in gay and bisexual men, regardless of race or ethnicity.
- 45% of new HIV infections occur in African Americans, 35% in whites, and 17% in Hispanics.

Improving access to quality healthcare for populations disproportionately affected by HIV, such as persons of color and gay and bisexual men, is a fundamental public health strategy for HIV prevention. People getting care for HIV can receive:

- Antiretroviral therapy
- Screening and treatment for other diseases (such as sexually transmitted infections)
- HIV prevention interventions
- Mental health services
- Other health services

As the number of people living with HIV increases and more people become aware of their HIV status, prevention strategies that are targeted specifically for HIV-infected people are becoming more important. Prevention work with people living with HIV focuses on:

- Linking to and staying in treatment.
- Increasing the availability of ongoing HIV prevention interventions.
- Providing prevention services for their partners.

Public perception in the US about the seriousness of the HIV epidemic has declined in recent years. There is evidence that risky behaviors may be increasing among uninfected people, especially gay and bisexual men. Ongoing media and social campaigns for the general public and HIV prevention interventions for uninfected persons who engage in risky behaviors are critical.

- Healthy People 2020 (www.healthypeople.gov)
Age-Adjusted HIV/AIDS Deaths
Between 2007 and 2016, there was an annual average age-adjusted HIV/AIDS mortality rate of 1.4 deaths per 100,000 population in the Metro Area.

- Higher than both of the statewide rates.
- Lower than the rate reported nationally.
- Satisfies the Healthy People 2020 target (3.3 or lower).

HIV/AIDS: Age-Adjusted Mortality
(2007-2016 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 3.3 or Lower

HIV Prevalence
In 2013, there was a prevalence of 192.2 HIV cases per 100,000 population in the Metro Area.

- Worse than both state prevalence rates.
- Better than the national prevalence.
- Considerably higher in Douglas County than in Sarpy, Cass, or Pottawattamie counties.
HIV Prevalence
(Prevalence Rate of HIV per 100,000 Population, 2013)

Sources: Centers for Disease Control and Prevention, National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention: 2013.

Notes: This indicator is relevant because HIV is a life-threatening communicable disease that disproportionately affects minority populations and may also indicate the prevalence of unsafe sex practices.

- By race and ethnicity, HIV/AIDS prevalence in the Metro Area is particularly high among non-Hispanic Blacks, although to a lesser degree than found nationally.

HIV Prevalence Rate by Race/Ethnicity
(Prevalence Rate of HIV per 100,000 Population, 2013)

Sources: Centers for Disease Control and Prevention, National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention: 2013.

Notes: This indicator is relevant because HIV is a life-threatening communicable disease that disproportionately affects minority populations and may also indicate the prevalence of unsafe sex practices.
HIV Testing
Among Metro Area adults age 18-44, 20.6% report that they have been tested for HIV in the past year.

- Comparable to the proportion found nationwide.
- Statistically similar findings by county.
- Lower in the western portion of Douglas County.
- TREND: Testing has increased significantly since 2011 in the Metro Area.

Tested for HIV in the Past Year
(Among Adults Age 18-44)

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 359]
Notes: Reflects respondents age 18 to 44.

Tested for HIV in the Past Year
(Among Adults Age 18-44)

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 359]
Notes: Reflects respondents age 18 to 44.
By demographic characteristics, these populations are less likely to have been tested for HIV in the past year:

- Men.
- Adults age 18 to 24.
- Adults age 35 to 44.
- Adults at either end of the income spectrum.
- Whites.

**Perceptions of HIV/AIDS as a Problem in the Community**

**Key Informant Input: HIV/AIDS**

Half of key informants taking part in an online survey characterized HIV/AIDS as a “minor problem” in the community.
Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

Access to Care/Services
- No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County
- Until recently there were no screenings or education services in North Omaha that were comprehensive and accessible. – Social Services Provider, Douglas County

Incidence/Prevalence
- I read NAP’s annual reports and receive updates from this organization, plus the community would rather ignore this issue. – Community Leader, Douglas County
- The increase in the number of cases of HIV/AIDS, particularly in the African-American community. – Other Health Provider, Douglas County

Denial/Stigma
- Because we do not want to talk about it. – Social Services Provider, Douglas County

Unprotected Sex
- Unprotected sexual activity. – Community Leader, Douglas County
Sexually Transmitted Diseases

About Sexually Transmitted Diseases

STDs refer to more than 25 infectious organisms that are transmitted primarily through sexual activity. Despite their burdens, costs, and complications, and the fact that they are largely preventable, STDs remain a significant public health problem in the United States. This problem is largely unrecognized by the public, policymakers, and health care professionals. STDs cause many harmful, often irreversible, and costly clinical complications, such as: reproductive health problems; fetal and perinatal health problems; cancer; and facilitation of the sexual transmission of HIV infection.

Because many cases of STDs go undiagnosed—and some common viral infections, such as human papillomavirus (HPV) and genital herpes, are not reported to CDC at all—the reported cases of chlamydia, gonorrhea, and syphilis represent only a fraction of the true burden of STDs in the US. Untreated STDs can lead to serious long-term health consequences, especially for adolescent girls and young women. Several factors contribute to the spread of STDs.

Biological Factors. STDs are acquired during unprotected sex with an infected partner. Biological factors that affect the spread of STDs include:

- **Asymptomatic nature of STDs.** The majority of STDs either do not produce any symptoms or signs, or they produce symptoms so mild that they are unnoticed; consequently, many infected persons do not know that they need medical care.
- **Gender disparities.** Women suffer more frequent and more serious STD complications than men do. Among the most serious STD complications are pelvic inflammatory disease, ectopic pregnancy (pregnancy outside of the uterus), infertility, and chronic pelvic pain.
- **Age disparities.** Compared to older adults, sexually active adolescents ages 15 to 19 and young adults ages 20 to 24 are at higher risk for getting STDs.
- **Lag time between infection and complications.** Often, a long interval, sometimes years, occurs between acquiring an STD and recognizing a clinically significant health problem.

Social, Economic, and Behavioral Factors. The spread of STDs is directly affected by social, economic, and behavioral factors. Such factors may cause serious obstacles to STD prevention due to their influence on social and sexual networks, access to and provision of care, willingness to seek care, and social norms regarding sex and sexuality. Among certain vulnerable populations, historical experience with segregation and discrimination exacerbates these factors. Social, economic, and behavioral factors that affect the spread of STDs include: racial and ethnic disparities; poverty and marginalization; access to healthcare; substance abuse; sexuality and secrecy (stigma and discomfort discussing sex); and sexual networks (persons “linked” by sequential or concurrent sexual partners).

- Healthy People 2020 (www.healthypeople.gov)

Chlamydia & Gonorrhea

In 2014, the chlamydia incidence rate in the Metro Area was 535.1 cases per 100,000 population.

- Worse than the state and US rates.
- Much higher in Douglas County (especially) and in Pottawattamie County.

The Metro Area gonorrhea incidence rate in 2014 was 138.7 cases per 100,000 population.

- Worse than the state and US rates.
- Much higher in Douglas County (especially) and in Pottawattamie County.
**Chlamydia & Gonorrhea Incidence**  
*(Incidence Rate per 100,000 Population, 2014)*

**Notes:**  
- This indicator is relevant because it is a measure of poor health status and indicates the prevalence of unsafe sex practices.  
- Data not available for Sarpy County in 2014.

- **TREND:** Note the increasing chlamydia trend over time in the Metro Area, echoing the state and US trends.

**Trend in Chlamydia Prevalence**  
*(Incidence Rate per 100,000 Population)*

**Notes:**  
- This indicator is relevant because it is a measure of poor health status and indicates the prevalence of unsafe sex practices.  
- Data not available for Sarpy County in 2014.
TREND: The gonorrhea prevalence trend is less clear.

### Trend in Gonorrhea Prevalence

### Safe Sexual Practices

#### Sexual Partners

**Number of Sexual Partners in Past 12 Months**

(Among Unmarried Adults Age 18-64; Metro Area, 2018)

- None 38.3%
- One 44.1%
- Two 8.9%
- Three/More 8.7%

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 329]

Notes: Asked of all unmarried respondents under the age of 65.
Among unmarried Metro Area adults under the age of 65, the majority cites having one (44.1%) or no (38.3%) sexual partners in the past 12 months. However, 8.7% report three or more sexual partners in the past year.

- Lower than that reported nationally.
- Keep in mind the small sample sizes in Western Douglas County and Cass County when evaluating percentage responses.
- TREND: Denotes a statistically significant increase over time in the Metro Area.

**Had Three or More Sexual Partners in the Past Year**

Notes:
- Asked of all unmarried respondents under the age of 65.
• Those who are more likely to report 3+ sexual partners include men, those under 40, upper-income residents, Whites, and “Other” races.

Had Three or More Sexual Partners in the Past Year
(Among Unmarried Adults Age 18-64; Metro Area, 2018)

Condoms

A total of 30.8% of unmarried Metro Area adults age 18 to 64 report that a condom was used during their last sexual intercourse.

• Lower than that reported nationally.
• The Cass County prevalence is comparatively low; however, note that the Cass County sample here is rather small.
  o Within Douglas County, response is markedly lower in Western Douglas (however, Western Douglas has a rather small sample size for this question).
• TREND: The 2018 prevalence marks a significant increase from 2011 survey results, although below what was found in 2015.

Notes: Asked of all unmarried respondents under the age of 65. Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents). Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes below the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.

**Key Informant Input: Sexually Transmitted Diseases**

Half of key informants taking part in an online survey characterized *Sexually Transmitted Diseases* as a “major problem” in the community.

**Perceptions of Sexually Transmitted Diseases as a Problem in the Community**
(Key Informants, 2018)

- **Major Problem**: 50.4%
- **Moderate Problem**: 29.1%
- **Minor Problem**: 15.6%
- **No Problem At All**: 5.0%

Sources: PRC Online Key Informant Survey, March 2018.

**Top Concerns**
Among those rating this issue as a “major problem,” reasons related to the following:

**Incidence/Prevalence**
- Douglas County again remains above national averages that are impacting all young people across the county. – Other Health Provider, Douglas County
- We have some of the highest STD rates in the nation. – Other Health Provider, Douglas County
High rates of STDs throughout the city. Although I think the folks in West Omaha don't think they have an issue, and much of the attention has been placed on North and South Omaha. – Social Services Provider, Douglas County

I believe Douglas County has one of the highest STD rates in the country. – Physician, Douglas County

We know that we have higher rates of certain STDs over much of the county. – Social Services Provider, Douglas County

High incidence in Douglas County. – Other Health Provider, Douglas County

STD rates are at an all-time high in Douglas County. – Public Health Representative, Douglas County

The numbers are staggering. – Social Services Provider, Douglas County

STI, the CDC has declared STI/STDs as an epidemic in Douglas County. I am not aware that dis-designation has changed. – Social Services Provider, Douglas County

Numbers of infections are on the rise. Population affected has broadened with evolution of sexual habits, behaviors. People still don't talk about problems when they arise and seek diagnosis and treatment. Education of health care providers. – Public Health Representative, Pottawattamie County

Pottawattamie county is one of the highest in the state for STDs. The free clinic in Council Bluffs is the only one of its kind going to Sioux City and Polk County. Many people don't have insurance so the free clinic is their only option. – Public Health Representative, Pottawattamie County

Continue to have high rates of STIs reported, particularly in Douglas County. I am hopeful, however, that with increased attention and funding we will begin to see a change. I think right now there is just more awareness being created on the issue. – Community Leader, Douglas County

Still a phenomenon but increased testing seems to be helping us get our arms better around this issue. – Community Leader, Douglas County

The data demonstrates a high incidence. – Social Services Provider, Douglas County

Data. – Public Health Representative, Douglas County

The metro area has certain STDs that are contracted at higher rates. Additional prevention efforts, interventions, and access to treatment across the entire city is needed. – Social Services Provider, Pottawattamie County

STDs high for low income community. – Community Leader, Douglas County

Due to local public health statistics. – Social Services Provider, Douglas County

We have one of the highest rates of STDs in the entire country. – Community Leader, Douglas County

Based on incidence reported by the Douglas County Health Department. – Social Services Provider, Douglas County

Douglas County’s notoriety as one of the leading counties for STI, STD transmission. In at least one or two diseases, is it any wonder that Pottawattamie County struggles with this issue as well. – Business Leader, Pottawattamie County

High rates of STDs for the past two decades. – Social Services Provider, Douglas County

We have very high rates. – Social Services Provider, Pottawattamie County

High rate of sexual activity and promiscuity. – Community Leader, Douglas County

High Rate of STDs. – Business Leader, Pottawattamie County

With one of the highest adolescent STD rates in the country, we cannot ignore this issue. – Social Services Provider, Douglas County

Based on statistics for STDs in this county compared to others. – Social Services Provider, Douglas County

One of the highest in the nation. – Community Leader, Douglas County

STDs can have long-term effects on health and well-being. Stigmas, embarrassed to seek services, "couldn’t happen to me" mindset. – Social Services Provider, Douglas County

As it is commonly known, there are high rates of STDs in Douglas County. Great strides have been made and this needs to continue. – Other Health Provider, Douglas County

Incidence of Chlamydia/Gonorrhea

Country's biggest area for chlamydia. – Other Health Provider, Pottawattamie County

We in Douglas County have an epidemic of gonorrhea and chlamydia. – Public Health Representative, Douglas County

This community outpaces the national average with chlamydia and gonorrhea. – Social Services Provider,
Douglas County

Very high rate of chlamydia in Northeast Omaha. – Social Services Provider, Douglas County

Epidemic of chlamydia and gonorrhea. – Community Leader, Douglas County

One of highest rates of chlamydia/gonorrhea in the country. – Social Services Provider, Douglas County

Health Awareness/Education

I wish I could answer this question. There has been a lot of focus on STDs in our community, but the intended impact doesn’t ever seem to be realized. – Social Services Provider, Douglas County

Lack of education. – Social Services Provider, Douglas County

Lack of education in all school systems. Denial that this is a huge problem in Omaha. – Social Services Provider, Douglas County

Lack of appropriate sexual health education. Stigma to receive testing. Culturally competent care. – Community Leader, Douglas County

Lack of health education. – Social Services Provider, Douglas County

Contributing Factors

Increased use of technology and social media for sexual partners. Use of apps such as Tinder, Grinder, Bumble, Plenty of Fish, lack of early and often comprehensive sex education in the schools. Lack of policy development around sexual health education. – Advanced Practice Provider, Douglas County

Access to Care/Services

No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County
Immunization & Infectious Diseases

Key Informant Input: Immunization & Infectious Diseases
Key informants taking part in an online survey most often characterized *Immunization & Infectious Diseases* as a “minor problem” in the community.

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

**Immunization Rates**
- Expectant mothers and mothers of infants do not immunize their children. – Community Leader, Douglas County
- Immunization rates are not meeting Healthy People 2020 objectives. – Public Health Representative, Douglas County

**Access to Care/Services**
- No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County

**Health Awareness/Education**
- Parent’s lack of facts. – Community Leader, Douglas County

**Poverty**
- Economic oppression. – Social Services Provider, Douglas County
Births
**Prenatal Care**

**About Infant & Child Health**

Improving the well-being of mothers, infants, and children is an important public health goal for the US. Their well-being determines the health of the next generation and can help predict future public health challenges for families, communities, and the healthcare system. The risk of maternal and infant mortality and pregnancy-related complications can be reduced by increasing access to quality preconception (before pregnancy) and inter-conception (between pregnancies) care. Moreover, healthy birth outcomes and early identification and treatment of health conditions among infants can prevent death or disability and enable children to reach their full potential. Many factors can affect pregnancy and childbirth, including pre-conception health status, age, access to appropriate healthcare, and poverty.

Infant and child health are similarly influenced by socio-demographic factors, such as family income, but are also linked to the physical and mental health of parents and caregivers. There are racial and ethnic disparities in mortality and morbidity for mothers and children, particularly for African Americans. These differences are likely the result of many factors, including social determinants (such as racial and ethnic disparities in infant mortality; family income; educational attainment among household members; and health insurance coverage) and physical determinants (i.e., the health, nutrition, and behaviors of the mother during pregnancy and early childhood).

- Healthy People 2020 (www.healthypeople.gov)

**Between 2014 and 2016, 25.7% of all Metro Area births did not receive prenatal care in the first trimester of pregnancy.**

- Similar to the Nebraska proportion, but higher than the Iowa proportion.
- Fails to satisfy the Healthy People 2020 target (22.1% or lower).
- Highest in Douglas County (data not available for Cass or Pottawattamie counties).

**Sources:**
- Centers for Disease Control and Prevention, National Center for Health Statistics. Accessed using CDC Wonder.
- *Does not include Cass or Pottawattamie counties, for which birth counts were too low for calculations.

**Note:**
- This indicator reports the percentage of women who do not obtain prenatal care during their first trimester of pregnancy. This indicator is relevant because engaging in prenatal care decreases the likelihood of maternal and infant health risks. This indicator can also highlight a lack of access to preventive care, a lack of health knowledge, insufficient provider outreach, and/or social barriers preventing utilization of services.
- *Does not include Cass or Pottawattamie counties, for which birth counts were too low for calculations.
Birth Outcomes & Risks

Low-Weight Births

A total of 7.4% of 2014-2016 Metro Area births were low-weight.

- Worse than the state proportions.
- Better than the US proportion.
- Satisfies the Healthy People 2020 target (7.8% or lower).
- Higher in Douglas County (data not available for Cass or Pottawattamie counties).

Low-Weight Births
(Percent of Live Births, 2014-2016)
Healthy People 2020 Target = 7.8% or Lower

Note:
- This indicator reports the percentage of total births that are low birthweight (under 2500g). This indicator is relevant because low-birthweight infants are at high risk for health problems. This indicator can also highlight the existence of health disparities.
- *Does not include Cass or Pottawattamie counties, for which birth counts were too low for calculations.

- TREND: The prevalence of low-weight births has remained stable over the past decade.

Note: • This indicator reports the percentage of total births that are low birthweight (Under 2500g). This indicator is relevant because low-birthweight infants are at high risk for health problems. This indicator can also highlight the existence of health disparities.
• *Does not include Cass or Pottawattamie counties, for which birth counts were too low for calculations.

Infant Mortality
Between 2014 and 2016, there was an annual average of 6.2 infant deaths per 1,000 live births.

- Less favorable than the Nebraska and Iowa rates.
- Comparable to the national rate.
- Similar to the Healthy People 2020 target of 6.0 per 1,000 live births or lower.
- Highest in Pottawattamie County.

Infant Mortality Rate
(Annual Average Infant Deaths per 1,000 Live Births, 2014-2016)
Healthy People 2020 Target = 6.0 or Lower

Notes: • Infant deaths include deaths of children under 1 year old.
• This indicator is relevant because high rates of infant mortality indicate the existence of broader issues pertaining to access to care and maternal and child health.
• *Does not include Cass County, for which birth counts were too low for calculations.
The infant mortality rate is considerably high among births to Non-Hispanic Black mothers.

**Infant Mortality by Race/Ethnicity**
*(Annual Average Infant Deaths per 1,000 Live Births, 2014-2016)*

**Healthy People 2020 Target = 6.0 or Lower**

- Metro Area Non-Hispanic White: 5.3
- Metro Area Non-Hispanic Black: 12.4
- Metro Area Hispanic: 6.1
- Metro Area* All Races/Ethnicities: 6.2

**Notes:**
- Infant deaths include deaths of children under 1 year old.
- This indicator is relevant because high rates of infant mortality indicate the existence of broader issues pertaining to access to care and maternal and child health.
- *Does not include Cass County, for which birth counts were too low for calculations.

**TREND:** In recent years in the Metro Area, the infant mortality rate has trended upward (rates do not include Cass County, for which birth counts were too low for inclusion).

**Infant Mortality Rate**
*(Annual Average Infant Deaths per 1,000 Live Births)*

**Healthy People 2020 Target = 6.0 or Lower**

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

Access to Care/Services

- Lack of access and economic misdistribution of resources. – Social Services Provider, Douglas County
- Lack of care in North Omaha. – Social Services Provider, Douglas County
- Keeping kids healthy is key to prevention and early intervention is critical. Access to services continues to be a challenge and we continue to see some disparities particularly in infant mortality. – Other Health Provider, Douglas County
- Lack of access to quality health care. Transportation limitations. – Community Leader, Douglas County
- Nebraska failed to expand Medicaid. Access to health care for low income mothers and children is affected. – Community Leader, Douglas County
- Funding and providers who will serve low income population. Often for the underinsured, working poor it is availability of convenient times to seek treatment. Lower income people do not have the job flex time often to take children to doctors. – Social Services Provider, Douglas County
- It is tied to high occurrence poverty areas. Food, transportation, co-pay, appointment convenience for weekend and evening. – Social Services Provider, Douglas County
- Young children are being diagnosed at an alarming rate with ADHD and other childhood attention disorders. Many in the rural areas are not receiving the dental or mental health services they need. At least that has been my experience. – Business Leader, Pottawattamie County

Infant Mortality

- Percent of children who die in the first year, especially low income parents, is too high. – Community Leader, Douglas County
- We still have a high maternal death rate here in Omaha, especially for black women. – Social Services Provider, Douglas County
- Infant mortality overall is on average, however, health disparities especially between African American and whites is pronounced. – Public Health Representative, Douglas County
- Infant mortality rates. – Public Health Representative, Douglas County
- Infant mortality in North Omaha, high rates, stark disparity. – Social Services Provider, Douglas County

Lack of Prenatal Care

- Lack of prenatal care and CHIP reduction. – Community Leader, Douglas County
- Children who don’t receive care from before birth and through their childhood are even more susceptible to
future health needs. They also don't establish a healthcare home which can set the trajectory of getting regular check-ups into adulthood. – Community Leader, Douglas County
Lack of prenatal planning, parental lack of knowledge. – Community Leader, Douglas County

Lifestyle
Mostly related to diet, nutrition or lack thereof, sugary drinks, sedentary lifestyles, poor sleep because of addition to screens. These detrimental habits are being ingrained in children which leads to poor health outcomes throughout their life. – Social Services Provider, Douglas County
We have world class health systems in Omaha, we have disparities within neighborhoods. We also have a weight issue in our youth. As screens and other sedentary activities become more prevalent, we must work to make physical activity and health. – Social Services Provider, Douglas County

Prevention
Not investing in preventative interventions and services, but rather still focusing on acute care when folks are identified as being ill. – Public Health Representative, Douglas County
Low social economic status of population leads to a death of parenting skills. Addressing health problems at an early age can lessen the future health needs as children mature. – Community Leader, Pottawattamie County

Health Awareness/Education
Lack of education and availability of services. – Other Health Provider, Pottawattamie County
Lack of information, resources and access to health care for prenatal, infant and children can have long-term implications for healthy outcomes. – Social Services Provider, Douglas County

Diet/Nutrition
Access to fresh produce. Access to school meals. This leads to the majority of chronic health issues along with decreased abilities to learn and graduate. – Social Services Provider, Douglas County

Elevated Blood Lead Levels
The number of children with elevated blood lead levels and the increasing number of children with asthma. – Other Health Provider, Douglas County
Family Planning

Births to Teen Mothers

**About Teen Births**
The negative outcomes associated with unintended pregnancies are compounded for adolescents. Teen mothers:

- Are less likely to graduate from high school or attain a GED by the time they reach age 30.
- Earn an average of approximately $3,500 less per year, when compared with those who delay childbearing.
- Receive nearly twice as much Federal aid for nearly twice as long.

Similarly, early fatherhood is associated with lower educational attainment and lower income. Children of teen parents are more likely to have lower cognitive attainment and exhibit more behavior problems. Sons of teen mothers are more likely to be incarcerated, and daughters are more likely to become adolescent mothers.

- Healthy People 2020 (www.healthypeople.gov)

Between 2014 and 2016, 4.5% of births to Metro Area females under 20 were to teens under the age of 20.

- Better than the state and US percentages.
- Higher in Douglas County (percentages not available for Cass or Pottawattamie counties).

Sources: Centers for Disease Control and Prevention, National Vital Statistics System. Accessed using CDC WONDER.

Notes: This indicator reports the rate of total births to women under the age of 20 per 1,000 female population under 20. This indicator is relevant because in many cases, teen parents have unique social, economic, and health support services. Additionally, high rates of teen pregnancy may indicate the prevalence of unsafe sex practices.

*Does not include Cass or Pottawattamie counties, for which birth counts were too low for calculations.

Key Informant Input: Family Planning

Key informants taking part in an online survey largely characterized Family Planning as a “moderate problem” in the community.

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

Access to Care/Services

According to the people we serve they feel they have had no one to talk to about this. – Social Services Provider, Douglas County

Lack of access to LARC, long acting birth control, to reduce teen pregnancies. Very effective in CO. Lack of education in the school systems. Still unplanned pregnancies in our community. – Social Services Provider, Douglas County

Planned Parenthood only open two days a week and patients need to show proof of income. The Free STD clinic only has one person working the clinic so it is often closed due to other job requirements. There is not enough education in the public schools. – Public Health Representative, Pottawattamie County

People need access to family planning services including access and availability to contraceptives. – Other Health Provider, Douglas County

Professional Research Consultants, Inc.
Lack of services in the community. – Social Services Provider, Douglas County
No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County
No access to family planning for all neighborhoods. Plus we have backwards religions that oppress women and use fertility to control. – Community Leader, Douglas County
We recently experienced some de-funding of Planned Parenthood, which was a resource in our community. We have problems with teen pregnancy, young parents and sexually transmitted infections. – Social Services Provider, Pottawattamie County

Teen Pregnancies
Inordinate amount of teen pregnancy, with need for prenatal care. – Community Leader, Pottawattamie County
Teens, young adults are having unplanned pregnancies without the financial means to care for the children. They have to rely on state assistance and Medicare, state child care assistance. Many of these woman do not seek prenatal care. – Business Leader, Pottawattamie County
Rate of unwed, teen parents in the Latino community is astounding and a cultural norm. The negative effects are related to unplanned births is lower educational attainment and life opportunities. Grandparents with significant parenting responsibilities. – Social Services Provider, Douglas County
Clues continue to seep out. Things such as teenage pregnancies with no prenatal care, hidden pregnancies with babies being terminated, abortions. – Social Services Provider, Douglas County
Family planning is important particularly for young people. Teen pregnancies and unplanned pregnancies could be reduced through appropriate information, contraceptives, condoms, and behavioral strategies, which would impact health and well-being. – Community Leader, Douglas County
Teen and unwed mothers. – Community Leader, Douglas County
We have seen progress in particular in teen pregnancy and need to continue efforts. With programs like Planned Parenthood at risk due to political climate, it will be particularly challenging to help families and individuals avoid unplanned pregnancies. – Other Health Provider, Douglas County

Health Awareness/Education
Access to information may be limited or biased. Children raising children is a challenging situation for all involved. – Social Services Provider, Douglas County
Comprehensive sex education lacking. – Community Leader, Douglas County
Creighton needs to offer more comprehensive services for staff, faculty and students. Also there needs to be options for the school-based health centers as well. – Social Services Provider, Douglas County
Sexual health curriculum still woefully outdated in many schools. Lack of strong connectivity for teens on services and resources to prevent unplanned pregnancies. – Community Leader, Douglas County

Affordable Care/Services
In the last 10 years, the availability of affordable family planning services has continued to decrease and the stigma has continued to increase. – Social Services Provider, Douglas County
There are no free or low cost options for family planning in Sarpy County. – Social Services Provider, Sarpy County

Poverty
Majority of families living in poverty in Douglas County are single mothers and of those moms, the percent of WIC or government assistance coverage is high. Access to long acting, reversible contraceptives and other tools is a barrier. – Other Health Provider, Douglas County

Unplanned Pregnancies
The growing number of unintended pregnancies resulting from the lack of access to affordable family planning services and products. – Other Health Provider, Douglas County

Denial/Stigma
Because we do not want to talk about it. – Social Services Provider, Douglas County

Incidence of STDs
High rate of STDs in Pottawattamie County. – Business Leader, Pottawattamie County
Modifiable Health Risks
Nutrition

About Healthful Diet & Healthy Weight

Strong science exists supporting the health benefits of eating a healthful diet and maintaining a healthy body weight. Efforts to change diet and weight should address individual behaviors, as well as the policies and environments that support these behaviors in settings such as schools, worksites, healthcare organizations, and communities.

The goal of promoting healthful diets and healthy weight encompasses increasing household food security and eliminating hunger.

Americans with a healthful diet:

- Consume a variety of nutrient-dense foods within and across the food groups, especially whole grains, fruits, vegetables, low-fat or fat-free milk or milk products, and lean meats and other protein sources.
- Limit the intake of saturated and trans fats, cholesterol, added sugars, sodium (salt), and alcohol.
- Limit caloric intake to meet caloric needs.

Diet and body weight are related to health status. Good nutrition is important to the growth and development of children. A healthful diet also helps Americans reduce their risks for many health conditions, including: overweight and obesity; malnutrition; iron-deficiency anemia; heart disease; high blood pressure; dyslipidemia (poor lipid profiles); type 2 diabetes; osteoporosis; oral disease; constipation; diverticular disease; and some cancers.

Diet reflects the variety of foods and beverages consumed over time and in settings such as worksites, schools, restaurants, and the home. Interventions to support a healthier diet can help ensure that:

- Individuals have the knowledge and skills to make healthier choices.
- Healthier options are available and affordable.

Social Determinants of Diet. Demographic characteristics of those with a more healthful diet vary with the nutrient or food studied. However, most Americans need to improve some aspect of their diet.

Social factors thought to influence diet include:

- Knowledge and attitudes
- Skills
- Social support
- Societal and cultural norms
- Food and agricultural policies
- Food assistance programs
- Economic price systems

Physical Determinants of Diet. Access to and availability of healthier foods can help people follow healthful diets. For example, better access to retail venues that sell healthier options may have a positive impact on a person’s diet; these venues may be less available in low-income or rural neighborhoods.

The places where people eat appear to influence their diet. For example, foods eaten away from home often have more calories and are of lower nutritional quality than foods prepared at home.

Marketing also influences people’s—particularly children’s—food choices.

- Healthy People 2020 (www.healthypeople.gov)
Daily Recommendation of Fruits/Vegetables

A total of 24.6% of Metro Area adults report eating five or more servings of fruits and/or vegetables per day.

- Less favorable than national findings.
- Similar findings by county.
  - Similar findings by community within Douglas County.
- TREND: Fruit/vegetable consumption has decreased significantly from previous survey findings.

Consume Five or More Servings of Fruits/Vegetables Per Day

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 148]

2017 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- For this issue, respondents were asked to recall their food intake on the previous day.

- TREND: Fruit/vegetable consumption in Douglas County is similar to baseline 2002 findings, but lower than found in other survey years. Note as well the statistically significant decrease in Sarpy/Cass counties from previous survey results.
Area men are less likely to get the recommended servings of daily fruits/vegetables, as are older residents and low-income adults.

**Consume Five or More Servings of Fruits/Vegetables Per Day**
(Metro Area, 2018)
**Access to Fresh Produce**

While most report little or no difficulty, 16.1% of Metro Area adults find it “very” or “somewhat” difficult to access affordable fresh fruits and vegetables.

---

**Level of Difficulty**

**Finding Fresh Produce at an Affordable Price**

(Metro Area, 2018)

- Very Difficult: 2.7%
- Somewhat Difficult: 13.4%
- Not Too Difficult: 24.6%
- Not At All Difficult: 59.3%

---

**Find It “Very” or “Somewhat” Difficult to Buy Affordable Fresh Produce**

- More favorable than national findings.
- Higher in Douglas County, and especially in Cass County.
  - Within Douglas County, unfavorably high in Southeast Omaha.
- TREND: Note the statistically significant improvement from 2011 survey findings.
Those more likely to report difficulty getting fresh fruits and vegetables include:

- Women.
- Adults under 65.
- Lower-income residents (especially).
- Non-Whites.

**Find It “Very” or “Somewhat” Difficult to Buy Affordable Fresh Produce**
(Metro Area, 2018)

Low Food Access (Food Deserts)

US Department of Agriculture data show that 19.2% of the Metro Area population (representing over 152,000 residents) have low food access or live in a “food desert,” meaning that they do not live near a supermarket or large grocery store.

- More favorable than statewide and US findings.
- Food deserts are more prevalent in Sarpy and Pottawattamie counties.
Population With Low Food Access
(Percent of Population That Is Far From a Supermarket or Large Grocery Store, 2015)

Sources:

Notes:
- This indicator reports the percentage of the population living in census tracts designated as food deserts. A food desert is defined as low-income areas where a significant number or share of residents is far from a supermarket, where “far” is more than 1 mile in urban areas and more than 10 miles in rural areas. This indicator is relevant because it highlights populations and geographies facing food insecurity.

- The following map provides an illustration of food deserts by census tract.
Sugar-Sweetened Beverages

A total of 24.3% of Metro Area adults report drinking an average of at least one sugar-sweetened beverage per day in the past week.

- More favorable than national findings.
- Viewed by county, lowest in Cass County.
  - Within Douglas County, lowest in Northwest Omaha.
- TREND: Denotes a statistically significant decrease since 2011.

### Had 7+ Sugar-Sweetened Beverages in the Past Week

![Graph showing percentage of individuals having 7+ sugar-sweetened beverages in the past week by county and year.]

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 360]

Notes: Asked of all respondents.

Those more likely to consume 7+ sugar-sweetened beverages per week include:

- Men.
- Younger adults.
- Lower-income residents.
- Black or Hispanic adults.
Had 7+ Sugar-Sweetened Beverages in the Past Week
(Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 360]

Notes: asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
**Physical Activity**

**About Physical Activity**

Regular physical activity can improve the health and quality of life of Americans of all ages, regardless of the presence of a chronic disease or disability. Among adults, physical activity can lower the risk of: early death; coronary heart disease; stroke; high blood pressure; type 2 diabetes; breast and colon cancer; falls; and depression. Among children and adolescents, physical activity can: improve bone health; improve cardiorespiratory and muscular fitness; decrease levels of body fat; and reduce symptoms of depression. For people who are inactive, even small increases in physical activity are associated with health benefits.

Personal, social, economic, and environmental factors all play a role in physical activity levels among youth, adults, and older adults. Understanding the barriers to and facilitators of physical activity is important to ensure the effectiveness of interventions and other actions to improve levels of physical activity.

Factors **positively** associated with adult physical activity include: postsecondary education; higher income; enjoyment of exercise; expectation of benefits; belief in ability to exercise (self-efficacy); history of activity in adulthood; social support from peers, family, or spouse; access to and satisfaction with facilities; enjoyable scenery; and safe neighborhoods.

Factors **negatively** associated with adult physical activity include: advancing age; low income; lack of time; low motivation; rural residency; perception of great effort needed for exercise; overweight or obesity; perception of poor health; and being disabled. Older adults may have additional factors that keep them from being physically active, including lack of social support, lack of transportation to facilities, fear of injury, and cost of programs.

Among children ages 4 to 12, the following factors have a positive association with physical activity: gender (boys); belief in ability to be active (self-efficacy); and parental support.

Among adolescents ages 13 to 18, the following factors have a positive association with physical activity: parental education; gender (boys); personal goals; physical education/school sports; belief in ability to be active (self-efficacy); and support of friends and family.

Environmental influences positively associated with physical activity among children and adolescents include:

- Presence of sidewalks
- Having a destination/walking to a particular place
- Access to public transportation
- Low traffic density
- Access to neighborhood or school play area and/or recreational equipment

People with disabilities may be less likely to participate in physical activity due to physical, emotional, and psychological barriers. Barriers may include the inaccessibility of facilities and the lack of staff trained in working with people with disabilities.

- Healthy People 2020 (www.healthypeople.gov)

**Leisure-Time Physical Activity**

A total of 22.1% of Metro Area adults report no leisure-time physical activity in the past month.

- Comparable to statewide findings.
- More favorable than national findings.
- Satisfies the Healthy People 2020 target (32.6% or lower).
• By county, the prevalence is highest in Pottawattamie County.
  ○ Unfavorably high in eastern Omaha.

• TREND: Note the statistically significant (and unfavorable) increase over time.

**No Leisure-Time Physical Activity in the Past Month**

*Healthy People 2020 Target = 32.6% or Lower*

- 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 89]

Notes:
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., "White" reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. "Very Low Income" includes households living with defined poverty status; "Low Income" includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Activity Levels

**Recommended Levels of Physical Activity**

Adults should do 2 hours and 30 minutes a week of moderate-intensity (such as walking), or 1 hour and 15 minutes (75 minutes) a week of vigorous-intensity *aerobic* physical activity (such as jogging), or an equivalent combination of moderate- and vigorous-intensity aerobic physical activity. The guidelines also recommend that adults do *muscle-strengthening* activities, such as push-ups, sit-ups, or activities using resistance bands or weights. These activities should involve all major muscle groups and be done on two or more days per week.

The report finds that nationwide nearly 50 percent of adults are getting the recommended amounts of aerobic activity and about 30 percent are engaging in the recommended muscle-strengthening activity.

- Learn more about CDC’s efforts to promote walking by visiting [http://www.cdc.gov/vitalsigns/walking](http://www.cdc.gov/vitalsigns/walking).

**Aerobic & Strengthening Physical Activity**

Based on reported physical activity intensity, frequency, and duration over the past month, 45.4% of Metro Area adults are found to be “insufficiently active” or “inactive.”

A total of 53.6% of Metro Area adults do not participate in any types of physical activities or exercises to strengthen their muscles.

**Participation in Physical Activities**
(Metro Area, 2018)

</table>

**Aerobic Activity**

**Strengthening Activity**

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [items 96, 150]

Notes:
- Reflects the total sample of respondents.
- In this case, “inactive” aerobic activity represents those adults participating in no aerobic activity in the past week; “insufficiently active” reflects those respondents with 1–149 minutes of aerobic activity in the past week; “active” adults are those with 150–300 minutes of aerobic activity per week; and “highly active” adults participate in 301+ minutes of aerobic activity weekly.
Recommended Levels of Physical Activity

A total of 22.0% of Metro Area adults regularly participate in adequate levels of both aerobic and strengthening activities (meeting physical activity recommendations).

- Similar to Nebraska and US proportions, better than the Iowa proportion.
- Satisfies the Healthy People 2020 target (20.1% or higher)
- TREND: Statistically unchanged since 2011 (not shown).

Meets Physical Activity Recommendations
Healthy People 2020 Target = 20.1% or Higher

Sources:
- 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 152]
- Behavioral Risk Factor Surveillance System Survey Data. Atlanta, Georgia. United States Department of Health and Human Services, Centers for Disease Control and Prevention (CDC); 2016 Nebraska and Iowa data.
- 2017 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Meeting both guidelines is defined as the number of persons age 18+ who report light or moderate aerobic activity for at least 150 minutes per week or who report vigorous physical activity 75 minutes per week, or an equivalent combination of moderate and vigorous-intensity activity, and report doing physical activities specifically designed to strengthen muscles at least twice per week.

Those **less** likely to meet physical activity requirements include:

- Women.
- Older residents.
- Adults in lower-income households.
- Hispanics.
- “Other” racial backgrounds.
Meets Physical Activity Recommendations

- 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 152]  
Notes:  
- Asked of all respondents.  
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).  
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level. “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.  
- Meeting both guidelines is defined as the number of persons age 18+ who report light or moderate aerobic activity for at least 150 minutes per week or who report vigorous physical activity 75 minutes per week or an equivalent combination of moderate and vigorous-intensity activity and report doing physical activities specifically designed to strengthen muscles at least twice per week.

Access to Physical Activity
In 2015, there were 13.9 recreation/fitness facilities for every 100,000 population in the Metro Area.
- Above what is found for both states and nationally.
- Lowest in Cass and Pottawattamie counties.

Notes:  
- Recreation and fitness facilities are defined by North American Industry Classification System (NAICS) Code 713940, which include Establishments engaged in operating facilities which offer “exercise and other active physical fitness conditioning or recreational sports activities.” Examples include athletic clubs, gymnasiums, dance centers, tennis clubs, and swimming pools. This indicator is relevant because access to recreation and fitness facilities encourages physical activity and other healthy behaviors.
Built Environment

Use of Local Parks & Recreation Centers

A total of 32.0% of Metro Area adults report using local parks or recreational centers for exercise at least weekly.

- Pottawattamie County adults are least likely to use local parks or recreation centers for exercise at least weekly.
  - Within Douglas County, weekly use is highest in Southwest Omaha.

- TREND: Weekly use of local parks or recreational centers in the Metro Area has dropped from previous findings.

Typically Use Local Parks or Recreation Centers for Exercise at Least Once a Week

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 333]

Notes: Asked of all respondents.

- TREND: Denotes a statistically significant decrease over time in Douglas County as well as Sarpy/Cass counties.
Typically Use Local Parks or Recreation Centers for Exercise at Least Once a Week

Viewed by demographic characteristics, these population samples are less likely to report weekly use of local parks or recreational centers:

- Older residents.
- Those in low-income households.

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 333]
Notes: Asked of all respondents.

Typically Use Local Parks or Recreation Centers for Exercise at Least Once a Week

Notes: Asked of all respondents. Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents). Income categories reflect respondent's household income as a ratio to the federal poverty level (FPL) for their household size: “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Use of Local Paved Roads or Dirt Trails

When asked how often they use a local paved or dirt trail for walking in good weather, nearly 6 in 10 community members said “never” (mentioned by 38.7%) or “less than one month” (19.3%).

- On the other hand, 15.0% of survey respondents use a paved or dirt trail for walking in good weather at least monthly, while 20.0% use one at least weekly, and 7.0% use one daily.

A total of 42.0% of Metro Area adults report using local trails at least monthly.

- By county, lowest in Pottawattamie County.
  o Lowest in Northeast Omaha.
- TREND: The overall prevalence denotes a statistically significant decrease over time.
Typically Use Local Paved or Dirt Trails for Walking, Hiking, or Biking at Least Once a Month in Good Weather

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 334]  
Notes: Asked of all respondents.

- TREND: Denotes a statistically significant decrease over time in Douglas County as well as Sarpy/Cass counties.

**Notes:**
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.

### Neighborhood Barriers

Survey respondents were next asked about the presence of 5 neighborhood factors that potentially prevent people from exercising, including lack of sidewalks or sidewalks in poor condition; heavy traffic; lack of trails or trails in poor condition; crime; and lack of streetlights or nonworking streetlights.

As can be seen in the following chart, a lack of sidewalks/poor sidewalks received the largest share of responses among community members (mentioned by 16.0%), followed by lack of trails or trails in poor condition (14.0%), heavy traffic (13.2%), lack of street lights or nonworking street lights (9.9%), and crime (8.6%).

- **TREND:** Over time, respondent perceptions of these barriers have either improved or remained stable.
Presence of Neighborhood Barriers That Prevent Physical Activity (Metro Area, 2018)

For further analysis, the following chart provides an illustration of respondents’ perceptions of neighborhood barriers, segmented by area of residence.
Weight Status

About Overweight & Obesity

Because weight is influenced by energy (calories) consumed and expended, interventions to improve weight can support changes in diet or physical activity. They can help change individuals’ knowledge and skills, reduce exposure to foods low in nutritional value and high in calories, or increase opportunities for physical activity. Interventions can help prevent unhealthy weight gain or facilitate weight loss among obese people. They can be delivered in multiple settings, including healthcare settings, worksites, or schools.

The social and physical factors affecting diet and physical activity (see Physical Activity topic area) may also have an impact on weight. Obesity is a problem throughout the population. However, among adults, the prevalence is highest for middle-aged people and for non-Hispanic black and Mexican American women. Among children and adolescents, the prevalence of obesity is highest among older and Mexican American children and non-Hispanic black girls. The association of income with obesity varies by age, gender, and race/ethnicity.

- Healthy People 2020 (www.healthypeople.gov)

Body Mass Index (BMI), which describes relative weight for height, is significantly correlated with total body fat content. The BMI should be used to assess overweight and obesity and to monitor changes in body weight. In addition, measurements of body weight alone can be used to determine efficacy of weight loss therapy. BMI is calculated as weight (kg)/height squared (m²). To estimate BMI using pounds and inches, use: [weight (pounds)/height squared (inches²)] x 703.

In this report, overweight is defined as a BMI of 25.0 to 29.9 kg/m² and obesity as a BMI ≥30 kg/m². The rationale behind these definitions is based on epidemiological data that show increases in mortality with BMIs above 25 kg/m². The increase in mortality, however, tends to be modest until a BMI of 30 kg/m² is reached. For persons with a BMI ≥30 kg/m², mortality rates from all causes, and especially from cardiovascular disease, are generally increased by 50 to 100 percent above that of persons with BMIs in the range of 20 to 25 kg/m².

Overweight Status
A total of 7 in 10 Metro Area adults (70.7%) are overweight.

- Comparable to the states and the US.
- By county, overweight is unfavorably high in Sarpy County, and particularly Cass County.
  - Within Douglas County, similar findings by community.
- TREND: Marks a statistically significant increase since 2011.

**TREND:** Denotes a statistically significant increase in overweight prevalence for Douglas County over time. In Sarpy/Cass counties, the prevalence is statistically similar to baseline 2008 data, but significantly above what was found in 2011 and 2015.
Further, 33.5% of Metro Area adults are obese.

- Comparable to state and US findings.
- Fails to satisfy the Healthy People 2020 target (30.5% or lower).
- Unfavorably high in Pottawattamie County.
  - Comparable findings by area within Douglas County.
- TREND: Denotes a statistically significant increase in obesity since 2011.

Prevalence of Obesity
(Percent of Adults With a Body Mass Index of 30.0 or Higher)

Healthy People 2020 Target = 30.5% or Lower

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 154]

Notes: Based on reported heights and weights, asked of all respondents.
The definition of obesity is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), greater than or equal to 30.0.
• TREND: Denotes a statistically significant increase in obesity for Douglas County over time; prevalence is statistically unchanged in Sarpy/Cass counties.

Prevalence of Obesity
(Percent of Adults With a Body Mass Index of 30.0 or Higher)

• Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
• Income categories reflect respondents’ household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL; earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
• The definition of obesity is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), greater than or equal to 30.0, regardless of gender.
Health Advice

A total of 22.1% of adults have been given advice about their weight by a doctor, nurse, or other health professional in the past year.

- Statistically similar to the national findings.
- TREND: Marks a statistically significant decrease from that reported in 2015.

Note that 27.2% of overweight/obese adults have been given advice about their weight by a health professional in the past year (while over 7 in 10 have not).

### Have Received Advice About Weight in the Past Year

### Relationship of Overweight With Other Health Issues

Overweight and obese adults are more likely to report a number of adverse health conditions. Among these are:

- Chronic pain.
- Activity limitations.
- “Fair/poor” physical health.
- Diabetes.
- Asthma.
- “Fair/poor” mental health.
- Chronic heart disease.

Overweight/obese residents are also more likely to be receiving treatment and/or medication for mental health issues.

Notes: Based on reported heights and weights, asked of all respondents.

Weight Loss Efforts

Over half (54.3%) of overweight/obese respondents are currently trying to lose weight.

- Lower than the national prevalence.
- Similar findings by county.
  - Within Douglas County, lowest in Northeast Omaha (equally low in Western Douglas; however, with the smaller sample size here, the difference is not statistically significant).

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

Access to Healthy Foods

- High poverty affects the above, availability of nutritious food, transportation, weight and depression. – Social Services Provider, Douglas County
- Affordable, accessible foods. Accessible places to be physically active and environments, employers, neighborhoods, social communities that support and encourage these behaviors. When you have many individuals who are struggling to make enough money. – Other Health Provider, Douglas County
- Access to nutritional food is needed in all areas of our community, which currently is not the case, food deserts. Education related to healthy foods and the importance of activity will help address weight challenges. Weight plays a critical role. – Community Leader, Douglas County
- Healthy food at affordable prices. Nutritional knowledge and access to farm to fork places. – Social Services Provider, Douglas County
- Abundance/availability of cheap, fatty, sugary, salty food. People eat processed foods and are cooking fresh food less. Healthy foods have a perceived higher cost, busy lifestyles make preparing meals difficult, the unhealthy option is often the easiest. – Social Services Provider, Douglas County
- Lack of access to affordable healthy foods, transportation, motivation and inspiration. – Social Services Provider, Douglas County
- Still food deserts in town and there are gun violence, gang issues that make outdoor activity unsafe in some parts of town, north and south. I also think that in addition to the farmers markets that we have, we need to offer more opportunities. – Social Services Provider, Douglas County
- Financial ability of many to purchase healthy food choices. Lack of education on proper nutrition and physical activity. – Social Services Provider, Douglas County
- Healthy food access and easy prep. Lack of pedestrian orientation and public safety in neighborhoods. Cultural support for healthy lifestyles. – Community Leader, Douglas County
- Low wages so it prohibits the ability to consistently eat a healthier diet. Access to fresh fruit and vegetables in all grocery stores. Safety issues in a neighborhood so not able to walk their community. Infrastructure, lack of sidewalks. – Social Services Provider, Douglas County
- Increased availability of unhealthy, inexpensive fast food. Poor school lunch nutrition, decreased use of public transportation, walking and bicycling to work and schools. – Advanced Practice Provider, Douglas County
- Access to healthy affordable nutritious food can be difficult for lower income and, or transportation limited citizens. Low cost or free activities to get to and maintain a healthy weight. – Social Services Provider, Douglas County
Access to healthy food options, healthy neighborhood stores and individual choices regarding food, activity and weight. – Public Health Representative, Douglas County

Many areas in Pottawattamie County would be considered food deserts where families and individuals cannot access healthy food choices. This is especially true in poorer communities where no or limited public transportation is present. – Business Leader, Pottawattamie County

Access to affordable nutritious food and community education about proper portions and nutritional content as well as activity options. – Social Services Provider, Douglas County

Food deserts and the lack of affordable recreational facilities. – Other Health Provider, Douglas County

Food insecurity. – Social Services Provider, Douglas County Personal management of diet and exercise.

Access and affordability of healthy food choices. Reliance on fast food. Safe neighborhoods, free of violence. – Social Services Provider, Douglas County

Part of food access is healthy nutrition. Unfortunately school meals aren’t always the healthiest and or offer the freshest of fruits and vegetables. – Social Services Provider, Douglas County

**Overweight/Obesity**

Obesity/overweight conditions have an increasing prevalence and begins a continuum of poor care across the spectrum of all patient ages. – Public Health Representative, Douglas County

Adult BMI rates continue to go up, compounded by issues of poverty, access to healthy foods and issues of neighborhood safety. – Social Services Provider, Douglas County

Obesity. – Other Health Provider, Douglas County

Obesity rate in Douglas County is still increasing whereby many areas around the country are seeing a leveling off or even a slight decrease. – Public Health Representative, Douglas County

Increased obesity. – Other Health Provider, Douglas County

Large percentage of overweight/obese. – Social Services Provider, Douglas County

Obesity is a major problem within this community. Too many single parent families or in families with both parents, either one or both are working long hours. They don’t have the time, money or knowledge to help children learn to eat the foods. – Physician, Douglas County

Among children, the rates of childhood overweight and obesity are not declining in our community despite national, more favorable trends. Adults in the past CHNA are more than 65% overweight or obese and thus the culture must continue to shift. – Other Health Provider, Douglas County

Obesity and inactivity, especially as it’s incidence is increasing in children and young adults. – Social Services Provider, Douglas County

Too many children and adults in our community are overweight and obese. This fact leads to other leading causes of death, heart disease, diabetes, etc. Most efforts focus on lifestyle changes. – Social Services Provider, Douglas County

**Diet/Nutrition**

A diet that does not encourage proper nutrition. Lack of exercise. – Community Leader, Douglas County

Lack of nutrition education, obesity and diabetes. – Social Services Provider, Douglas County

Poor diet. Too many fast food joints. Too much high fat food intake. – Physician, Pottawattamie County

Lack of a balance, healthy diet. No emphasis on portion control. – Community Leader, Pottawattamie County

Behavior change needed to cook and eat more healthy meals. Low cost, no cost exercise programs that are easy and can be done at home or in the neighborhood with friends. – Social Services Provider, Douglas County

**Lack of Physical Activity**

As our activities become more sedentary, we must address our community’s issues with weight, physical inactivity and poor nutrition. – Social Services Provider, Douglas County

City Public Works and mayor’s office lack of commitment to implementing urban design to encourage and support an active lifestyle. Still too car-focused, even if the talk coming from these offices is good, the action, budget, and commitment to implement. – Business Leader, Douglas County

Safe place for kids to play outside, increase in obesity, cost of healthy food. – Social Services Provider, Douglas County

Lack of available resources for exercise in the winter. People have a hard time with more complex calorie counting and budgeting. Basic messages are easy, but not many resources for more in depth look at calories. – Physician, Douglas County
We have an obesity problem because we don't have good walking, biking trail system and walking isn't a major part of our daily activity. – Community Leader, Douglas County

**Lifestyle**

High levels of obesity due to sedentary culture, bad diet and limited pedestrian and bicycle infrastructure to encourage active lifestyles. – Community Leader, Douglas County

Motivating people off a sedentary lifestyle is challenging as is educating about healthy food choices. – Community Leader, Douglas County

Motivation, inspiration, education regarding right foods, time, sedentary lifestyle, access to cleaner eating habits. – Public Health Representative, Pottawattamie County

Lack of family meal panning, the five food groups are essential for proper nutrition. Lack of sleep per appropriate age groups. More education is needed to residents in the community, for these two areas. Basic exercise at no cost to the family. – Social Services Provider, Douglas County

**Access to Care/Services**

No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County

Access to health professionals trained in motivational interviewing. – Other Health Provider, Pottawattamie County

**Health Awareness/Education**

Education. – Business Leader, Pottawattamie County

Lack of education. – Social Services Provider, Pottawattamie County

**Environmental Contributors**

Climate limits outdoor activity for some. Work and other life priorities limit time availability for physical activity.

The region is not known as a popular nutrition friendly region. – First Responder, Douglas County

**Poverty**

Poverty. – Social Services Provider, Douglas County
Substance Abuse

About Substance Abuse

Substance abuse has a major impact on individuals, families, and communities. The effects of substance abuse are cumulative, significantly contributing to costly social, physical, mental, and public health problems. These problems include:

- Teenage pregnancy
- Human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS)
- Other sexually transmitted diseases (STDs)
- Domestic violence
- Child abuse
- Motor vehicle crashes
- Physical fights
- Crime
- Homicide
- Suicide

Substance abuse refers to a set of related conditions associated with the consumption of mind- and behavior-altering substances that have negative behavioral and health outcomes. Social attitudes and political and legal responses to the consumption of alcohol and illicit drugs make substance abuse one of the most complex public health issues. In addition to the considerable health implications, substance abuse has been a flashpoint in the criminal justice system and a major focal point in discussions about social values: people argue over whether substance abuse is a disease with genetic and biological foundations or a matter of personal choice.

Advances in research have led to the development of evidence-based strategies to effectively address substance abuse. Improvements in brain-imaging technologies and the development of medications that assist in treatment have gradually shifted the research community’s perspective on substance abuse. There is now a deeper understanding of substance abuse as a disorder that develops in adolescence and, for some individuals, will develop into a chronic illness that will require lifelong monitoring and care.

Improved evaluation of community-level prevention has enhanced researchers’ understanding of environmental and social factors that contribute to the initiation and abuse of alcohol and illicit drugs, leading to a more sophisticated understanding of how to implement evidence-based strategies in specific social and cultural settings.

A stronger emphasis on evaluation has expanded evidence-based practices for drug and alcohol treatment. Improvements have focused on the development of better clinical interventions through research and increasing the skills and qualifications of treatment providers.

- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Cirrhosis/Liver Disease Deaths

Between 2014 and 2016, the Metro Area reported an annual average age-adjusted cirrhosis/liver disease mortality rate of 8.8 deaths per 100,000 population.

- Similar to both statewide rates, but below the US rate.
- Fails to satisfy the Healthy People 2020 target (8.2 or lower).
- The rate is lowest in Sarpy County.
Cirrhosis/Liver Disease: Age-Adjusted Mortality
(2014-2016 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 8.2 or Lower

TREND: The mortality rate has increased over time in the region, echoing both state and national trends.

Cirrhosis/Liver Disease: Age-Adjusted Mortality Trends
(Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 8.2 or Lower

Sources:

- 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 172]
- 2017 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Excessive drinking reflects the number of persons aged 18 years and over who drank more than two drinks per day on average (for men) or more than one drink per day on average (for women) OR who drank 5 or more drinks during a single occasion (for men) or 4 or more drinks during a single occasion (for women) during the past 30 days.

- Excessive drinking is more prevalent among men, younger adults, upper-income residents, Whites, and Hispanics.
Excessive Drinkers
(Metro Area, 2018)
Healthy People 2020 Target = 25.4% or Lower

Current Drinking (Douglas County Only)
According to the CDC 2016 BRFSS data for Douglas County, 61.1% of Douglas County residents are current drinkers (having one or more alcoholic drinks in the past month).

- TREND: The prevalence is statistically unchanged over time in Douglas County.
The following chart provides an illustration of the Douglas County BRFSS findings on current drinkers by demographic characteristics.

**Sources:** 2016 Behavioral Risk Factor Surveillance System (BRFSS) Data for Douglas County. Douglas County Health Department

**Notes:**
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Current drinkers are defined as those having at least one drink in the past month.

### Chronic Drinking (Douglas County Only)

2016 BRFSS data for Douglas County show that 6.1% of Douglas County residents are **chronic drinkers** (men having more than 2 drinks per day and women having more than one drink per day).

**TREND:** The prevalence denotes a statistically significant increase over time in Douglas County.

### Chronic Drinkers
(2016)

**Notes:**
- In this case, chronic drinkers are defined as adults who self-report as heavy drinkers (adult men having more than two drinks per day and adult women having more than one drink per day).
- The US prevalence does not distinguish chronic drinking by gender.
The following chart provides an illustration of the Douglas County BRFSS findings on chronic drinkers by demographic characteristics.

### Chronic Drinkers
(Douglas County, 2016)

![Chart showing chronic drinkers by demographic characteristics](chart)

**Sources:** 2016 Behavioral Risk Factor Surveillance System (BRFSS) Data for Douglas County, Douglas County Health Department

**Notes:**
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
- In this case, chronic drinkers are defined as adults who self-report as heavy drinkers (adult men having more than two drinks per day and adult women having more than one drink per day).

### Binge Drinking (Douglas County Only)

According to the CDC 2016 BRFSS data for Douglas County, 20.3% of county residents are binge drinkers (men having 5+ alcohol drinks on any one occasion or women having 4+ drinks on any one occasion).

- **TREND:** The prevalence has increased significantly over time in Douglas County.

**Drinking & Driving**  
A total of 5.0% of Metro Area adults acknowledge having driven a vehicle in the past month after they had perhaps too much to drink.

- Similar to the Nebraska and US findings, lower than the Iowa prevalence.  
- Viewed by county: highest in Douglas County, lowest in Cass County.  
  - Lowest in Douglas County in Northeast Omaha.  
- TREND: The drinking and driving prevalence has not changed significantly since 2011.
Have Driven in the Past Month After Perhaps Having Too Much to Drink

Notes: • Asked of all respondents.

• TREND: The drinking and driving prevalence has not changed significantly over time in Douglas County and in Sarpy/Cass counties.

Age-Adjusted Unintentional Drug-Related Deaths

Between 2014 and 2016, there was an annual average age-adjusted unintentional drug-related mortality rate of 7.2 deaths per 100,000 population in the Metro Area.

• Lower than the Iowa rate and especially the US rate; higher than the Nebraska rate.
• Satisfies the Healthy People 2020 target (11.3 or lower), which includes both intentional and unintentional drug-related deaths.

• Highest in Pottawattamie County.

### Unintentional Drug-Related Deaths: Age-Adjusted Mortality

County, state and national data are simple three-year averages.
Illicit Drug Use

Shared Prescriptions

A total of 8.0% of Metro Area adults acknowledge sharing a prescription medication with another person.

- Viewed by county, the percentage is highest in Douglas County.
  - Within Douglas County, the prevalence is highest in Southwest Omaha.

Have Ever Shared Prescription Medication With Someone Else

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 320]
Notes: Asked of all respondents.

- Sharing prescriptions is reported more often among young adults, upper-income residents, and Whites.

Have Ever Shared Prescription Medication With Someone Else
(Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 320]
Notes: Asked of all respondents.

For the purposes of this survey, "illicit drug use" includes use of illegal substances or of prescription drugs taken without a physician’s order.

Note: As a self-reported measure – and because this indicator reflects potentially illegal behavior – it is reasonable to expect that it might be underreported, and that actual illicit drug use in the community is likely higher.
Use of Opioids/Opiates

A total of 18.1% of Metro Area adults used opioids or opiates in the past year, whether prescribed or not.

- Viewed by county, the prevalence is significantly high in Pottawattamie County (Cass County prevalence is not significant due to smaller sample size).
  - The prevalence is unfavorably high in Western Douglas County.

Used Opioids or Opiates in the Past Year, Whether Prescribed or Not

Use of opioids/opiates is more prevalent among Metro Area women, adults age 40 to 64, and residents in lower-income households.

Used Opioids or Opiates in the Past Year, Whether Prescribed or Not (Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 321]
Notes: Asked of all respondents.
Alcohol & Drug Treatment

A total of 3.6% of Metro Area adults report that they have sought professional help for an alcohol or drug problem at some point in their lives.

- Similar to national findings.
- Viewed by county, the prevalence is lowest in Pottawattamie County.
  - Within Douglas County, the prevalence is highest in Northeast Omaha.
- Trend: Statistically unchanged over time.

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

Access to Care/Services

- Insufficient services. – Community Leader, Douglas County
- Access to treatment. – Other Health Provider, Pottawattamie County
- Resources on the part of the affected population. Their interest, financial ability, insurance coverage, and such. – Social Services Provider, Douglas County
- Lack of facilities available. – Public Health Representative, Pottawattamie County
- We do not provide services in Pottawattamie County for substance abuse. – Other Health Provider, Pottawattamie County
- Acute ETOH detox and then treatment. – Physician, Douglas County
- Access to substance abuse treatment, limited available services for substance abuse treatment and funding. – Advanced Practice Provider, Douglas County
- Access to the right level of care, transportation, payment. Step-down programs not always available. Peer support needs to be increased. Support groups need to be increased. – Social Services Provider, Douglas County
- No local accessibility for treatment, care. Must commute to Omaha or Lincoln for services. – First Responder, Cass County
- Assess to timely service and the right service when needed. – Social Services Provider, Douglas County
- Lack of available resources and access. – Social Services Provider, Douglas County
- Availability and cost. – Social Services Provider, Douglas County
- Disparity in access to treatment and supporting resources for youth and adults regardless of income. – Social Services Provider, Douglas County
- High binge drinking, insufficient treatment options, especially for youth. – Social Services Provider, Douglas County
- Again, laws should be changed so that parents of adult children can force treatment. These people need help but instead are jailed where the perception is that drugs are still available. Then have a criminal record which can hamper job opportunities. – Other Health Provider, Douglas County
- We have no evidence based interventions in Omaha. People are forced to rely upon AA, NA which has zero effectiveness. – Community Leader, Douglas County
- All of the same as mental health. – Social Services Provider, Pottawattamie County
Incidence/Prevalence

Due to published statistics. – Social Services Provider, Douglas County
High rate of substance abuse, especially prescription narcotics, and not enough treatment personnel or facilities to care for those afflicted. – Public Health Representative, Douglas County
Overwhelming use of illicit substances, which relates to societal questions regarding poverty, low wages and income inequality. – Physician, Pottawattamie County
We are in the midst of probably the largest opioid epidemic in our countries history and we have effective programs to support people struggling with addictions. However, we do not have the capacity to support the number of people needing help. – Social Services Provider, Douglas County
Huge substance abuse problem. – Other Health Provider, Pottawattamie County
Drugs are becoming too accessible in our communities and law enforcement is very limited in enforcement. There are very few resources available in our area. – Community Leader, Cass County
Excessive alcohol consumption since Nebraska has a very high rate and is the 42 worst state in the nation. – Public Health Representative, Douglas County

Affordable Care/Services

Cost, location of facilities. – Social Services Provider, Douglas County
Cost and stigma. – Social Services Provider, Douglas County
Lack of insurance that covers the cost of treatment. People cannot afford to take time off work to go to treatment without risking homelessness. The void left when Catholic Charities stopped providing substance abuse treatment in Omaha. – Social Services Provider, Douglas County
As with mental health care, too many people lack insurance or affordable insurance to access the help they need. And again, the providers that do provide free/sliding fee help are overwhelmed. – Social Services Provider, Douglas County
Available programs that are affordable and covered by insurance. Teen specific programing including outpatient options. Effective programing for meth and opioid use specifically. – Social Services Provider, Douglas County

Lack of Providers

Access to providers and assessing for substance in an integrated care clinic, physical and behavioral health. – Public Health Representative, Douglas County
Lack of adequate number of providers. – Social Services Provider, Douglas County
Lack of providers and treatment programs. – Social Services Provider, Pottawattamie County
Lack of providers and affordability. – Social Services Provider, Douglas County
Not enough care providers for people without resources to address the issue in our county. – Community Leader, Douglas County

Denial/Stigma

Motivation to stop using. The cycle of dependence, mental health issues, the actual addiction itself, family dynamics, a using partner, stress from life problems and the inability to cope with them. – Business Leader, Pottawattamie County
Stigma, providers not educated on how to partner with patients in treatment, lack of detox locations, treatment opportunities, lack of knowledge in medication options to treat patients as a chronic condition. – Social Services Provider, Douglas County
Stigma, lack of inpatient facilities and cost. – Other Health Provider, Douglas County
Stigma and access to care. – Social Services Provider, Douglas County
Transportation and stigma. – Community Leader, Douglas County

Lack of Inpatient Facilities

Insurance and availability for inpatient programs and insurance for outpatient programs. – Other Health Provider, Douglas County
Lack of inpatient facilities, inadequate outpatient programs, stigma, differences among substance abusers, alcoholic versus heroin addict, require different treatment methods. Insufficient support for families if a parent is in treatment. – Social Services Provider, Douglas County
Growing and pervasive issue with limited inpatient or residential types of services available. Residents have to
leave town to get treatment. – Social Services Provider, Douglas County

There are not enough inpatient programs for our youth and adults. We do not have a detox facility. The number of outpatient offerings are small. – Postsecondary Educator, Pottawattamie County

Lack of Funding

Lack of funding and sufficient intervention programs to treat addiction. Too much reliance on the criminal justice system. – Social Services Provider, Douglas County

Lack of funding. Federal pass through money that comes into Nebraska from SAMSHA trickles down to local programs. There is rarely funding for expansion or new programs. The 1.3 million for opioid addiction was not distributed to programs that serve. – Social Services Provider, Douglas County

Prevention

Lack of prevention, treatment programs and facilities. – Other Health Provider, Douglas County

Prevention/early intervention services are needed. Not enough detox facilities or affordable treatment programs. Patients need access to mental health supports upon discharge from treatment. Need to close the communication gap between medical providers. – Social Services Provider, Pottawattamie County

Mental Health

The lack of mental health options is driving the substance abuse problem. People are self-medicating to help with their mental health issues, which leads to addiction and breaking the law in many instances. – Public Health Representative, Pottawattamie County

Marijuana Use

When I think of substance abuse, I’m thinking of rise in the use of marijuana, not only the drugs that are considered hard core like meth. The growing state by state legalization and the growing vocal support for medical marijuana. – Business Leader, Pottawattamie County

Prescription Drug Abuse

Prescription drug availability. – Business Leader, Pottawattamie County

Most Problematic Substances

Key informants (who rated this as a “major problem”) clearly identified **alcohol** as the most problematic substance abused in the community, followed by **methamphetamine/other amphetamines** and **prescription medications**.

Tobacco Use

About Tobacco Use

Tobacco use is the single most preventable cause of death and disease in the United States. Scientific knowledge about the health effects of tobacco use has increased greatly since the first Surgeon General’s report on tobacco was released in 1964.

Tobacco use causes:

- Cancer
- Heart disease
- Lung diseases (including emphysema, bronchitis, and chronic airway obstruction)
- Premature birth, low birth weight, stillbirth, and infant death

There is no risk-free level of exposure to secondhand smoke. Secondhand smoke causes heart disease and lung cancer in adults and a number of health problems in infants and children, including: severe asthma attacks; respiratory infections; ear infections; and sudden infant death syndrome (SIDS).

Smokeless tobacco causes a number of serious oral health problems, including cancer of the mouth and gums, periodontitis, and tooth loss. Cigar use causes cancer of the larynx, mouth, esophagus, and lung.

Cigarette Smoking

Cigarette Smoking Prevalence

A total of 11.7% of Metro Area adults currently smoke cigarettes, either regularly (8.5% every day) or occasionally (3.2% on some days).

Cigarette Smoking Prevalence
(Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 49]
Notes: Asked of all respondents.
• More favorable than state and US findings.
• Similar to the Healthy People 2020 target (12% or lower).
• Statistically similar findings by county.
  o Highest in Northeast Omaha.
• TREND: The percentage denotes a statistically significant decrease since 2015.

**Environmental Tobacco Smoke**

A total of 7.3% of Metro Area adults (including smokers and nonsmokers) report that a member of their household has smoked cigarettes in the home an average of 4+ times per week over the past month.

- More favorable than national findings.
- Statistically similar findings by county.
  - Unfavorably high in Northeast Omaha.
- **TREND:** Marks a statistically significant decrease over time.

Note that 2.6% of Metro Area nonsmokers are exposed to cigarette smoke at home, similar to what is found nationally.
Member of Household Smokes at Home

**TREND:** Smoking in the home has **decreased** significantly over time for Douglas County and Sarpy/Cass counties.

Smoking Cessation

#### About Reducing Tobacco Use

Preventing tobacco use and helping tobacco users quit can improve the health and quality of life for Americans of all ages. People who stop smoking greatly reduce their risk of disease and premature death. Benefits are greater for people who stop at earlier ages, but quitting tobacco use is beneficial at any age.

Many factors influence tobacco use, disease, and mortality. Risk factors include race/ethnicity, age, education, and socioeconomic status. Significant disparities in tobacco use exist geographically; such disparities typically result from differences among states in smoke-free protections, tobacco prices, and program funding for tobacco prevention.

- Healthy People 2020 (www.healthypeople.gov)

#### Smoking Cessation Attempts

One-half (50.7%) of regular smokers went without smoking for one day or longer in the past year because they were trying to quit smoking.

- Much higher than the national percentage.
- Fails to satisfy the Healthy People 2020 target (80% or higher).

Most current smokers (66.3%) have been advised by a healthcare professional in the past year to quit smoking.
Two-thirds of current smokers (86.3%) were advised to quit in the past year by a healthcare professional.

Douglas County Only: According to the CDC 2016 BRFSS data for Douglas County, 54.8% of smokers in Douglas County have stopped smoking for at least one day in the past year in order to quit smoking.

- TREND: Cessation attempts among Douglas County smokers appear to have increased significantly from baseline survey results.

Sources:
- 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Items 50-51]
- 2017 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of respondents who smoke cigarettes every day.

- 2016 Behavioral Risk Factor Surveillance System (BRFSS) Data for Douglas County, Douglas County Health Department

- The 2012-2016 BRFSS data are not directly comparable to previous years of BRFSS data because of the changes in weighting methodology and the addition of the cell phone sampling frame.
Other Tobacco Use

Use of Vaping Products
A total of 4.4% of Metro Area adults currently use electronic cigarettes (e-cigarettes) or other electronic vaping products either regularly (1.9% every day) or occasionally (2.5% on some days).

Electronic Cigarette (E-Cigarette) Smoking Prevalence
(Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 163]
Notes: Asked of all respondents.

- Similar to state and national findings.
- Vaping is more prevalent in Sarpy County.
  - Similar by area within Douglas County.
- TREND: The prevalence is statistically unchanged since 2015.

Currently Use Electronic Cigarettes (E-Cigarettes)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 163]
- 2017 PRC National Health Survey, Professional Research Consultants, Inc.
Notes: Asked of all respondents.
Electronic cigarette/other vaping product use is more prevalent among:

- Adults under age 65 (negative correlation with age).
- Lower-income residents (negative correlation with income).

</table>

Incidence/Prevalence

We continue to see disparities in tobacco use as well as youth initiating this behavior. This is a behavior with clear, concrete impacts on health and through continued efforts to reduce could have a clear, positive impact on the health of the community.

Other Health Provider, Douglas County

Many tobacco users in the county. No resources available to help with quitting and stores have limited to no smoking cessation products to assist those who want to quit. – First Responder, Cass County
Tobacco use is rampant across our community and occurs in our parks, fairgrounds, school events. Tobacco products are being used in front of children, exposing them to second-hand smoke and promoting a deadly habit. – Community Leader, Cass County

Tobacco use still happens. – Social Services Provider, Douglas County

Too many smokers and smoke related illnesses. – Physician, Pottawattamie County

There are still people who smoke and it is unhealthy. – Social Services Provider, Pottawattamie County

Rates are beginning to creep up after years of decline. Number one preventable disease cause. – Other Health Provider, Douglas County

The detrimental health consequences of tobacco use are astronomical, yet, people continue to smoke and initiate second hand smoke for non-smokers. – Community Leader, Douglas County

Data. – Public Health Representative, Douglas County

Smoking and chewing tobacco is still used a lot by both adults and teens. – Social Services Provider, Douglas County

Targeting of community by tobacco industry and the profits that can be made by stores in the community from tobacco sales. – Community Leader, Douglas County

Still too many people smoking. Particular concern is the high number of women turning to smoking for stress relief. – Social Services Provider, Douglas County

Any use of tobacco is too much. We need to encourage more cessation programs. Should consider increase in tobacco tax. – Community Leader, Douglas County

It's the number one preventable leading causes of lung cancer deaths. Approximately 17% of adult Nebraskans are current smokers. Over 2,500 deaths are related to tobacco use every year. – Social Services Provider, Douglas County

Vaping/E-Cigarettes

When I think of tobacco, cigarettes, chewing tobacco and pipe, cigar comes to mind. More recently, however, I am growing more concerned with the practice of vaping which seems to be capturing the imagination of young and old alike. – Business Leader, Pottawattamie County

Vaping leads to tobacco use. Easy access. Generations of smokers. Resources spread thin over many counties. – Public Health Representative, Pottawattamie County

Visual number of people smoking or vaping and ads for such. – Social Services Provider, Douglas County

Smoke free zones are not enforced, widespread use of vaporizers as a substitute for nicotine addiction. – Advanced Practice Provider, Douglas County

Adolescent Use

It's illegal and accessible and we still have high rates of young people who are still using. – Public Health Representative, Pottawattamie County

Most addiction to tobacco products begins in adolescence and with the new methodologies to using nicotine, e-cigs and vaping and oral tobacco, there is an upswing in new tobacco users. – Public Health Representative, Douglas County

Incidence of Cancer

Cancer is rampant here. So much so, they built a cancer center here. – Social Services Provider, Douglas County

Tobacco causes cancer and other health issues. – Social Services Provider, Douglas County

Generational Differences

Generational differences. – Other Health Provider, Douglas County
Access to Health Services
Health Insurance Coverage

Type of Healthcare Coverage

A total of 76.4% of Metro Area adults age 18 to 64 report having healthcare coverage through private insurance. Another 15.7% report coverage through a government-sponsored program (e.g., Medicaid, Medicare, military benefits).

Healthcare Insurance Coverage
(Among Adults Age 18-64; Metro Area, 2018)

Sources:  2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 169]
Notes:  Reflects respondents age 18 to 64.

Lack of Health Insurance Coverage

Among adults age 18 to 64, 7.9% report having no insurance coverage for healthcare expenses.

- Lower than the Nebraska and US findings; similar to the Iowa prevalence.
- The Healthy People 2020 target is universal coverage (0% uninsured).
- Viewed by county, the prevalence of uninsured is highest in Douglas County.
  - Within Douglas County, unfavorably high in Southeast Omaha.
- TREND: Denotes a statistically significant decrease over time.

Notes: Asked of all respondents under the age of 65.

The following population segments are more likely to be without healthcare insurance coverage:

- Men.
- Young adults.
- Residents living at lower incomes (note the 22.1% uninsured prevalence among very low-income adults).
- Black residents.
- Hispanics.

**Lack of Healthcare Insurance Coverage**
(Among Adults Age 18-64; Metro Area, 2018)

**Healthy People 2020 Target = 0.0% (Universal Coverage)**

As might be expected, uninsured adults in the Metro Area are less likely to receive routine care and preventive health screenings and are more likely to have experienced difficulties accessing healthcare.

**Preventive Healthcare**
(By Insured Status; Metro Area, 2018)
Recent Lack of Coverage
Among currently insured adults in the Metro Area, 3.7% report that they were without healthcare coverage at some point in the past year.

- By county, favorably low in Sarpy County.
  - Within Douglas County, highest in Northeast Omaha.
- TREND: Marks a statistically significant decrease in insurance instability.

Went Without Healthcare Insurance Coverage At Some Point in the Past Year
(Among Insured Adults)

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 328]
Notes: Asked of all insured respondents.

- TREND: Marks a statistically significant decrease in insurance instability in Douglas County (statistically unchanged over time for Sarpy/Cass).

Went Without Healthcare Insurance Coverage At Some Point in the Past Year
(Among Insured Adults)
Among insured adults, the following segments are more likely to have gone without healthcare insurance coverage at some point in the past year:

- Women.
- Adults under age 40.
- Lower-income residents.
- Black residents.

- Asked of all insured respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Difficulties Accessing Healthcare

About Access to Healthcare

Access to comprehensive, quality health care services is important for the achievement of health equity and for increasing the quality of a healthy life for everyone. It impacts: overall physical, social, and mental health status; prevention of disease and disability; detection and treatment of health conditions; quality of life; preventable death; and life expectancy.

Access to health services means the timely use of personal health services to achieve the best health outcomes. It requires three distinct steps: 1) Gaining entry into the health care system; 2) Accessing a health care location where needed services are provided; and 3) Finding a health care provider with whom the patient can communicate and trust.

- Healthy People 2020 (www.healthypeople.gov)

Difficulties Accessing Services

A total of 31.7% of Metro Area adults report some type of difficulty or delay in obtaining healthcare services in the past year.

- More favorable than national findings.
- The prevalence is highest in Douglas County.
  - Within Douglas County, unfavorably high in Northeast Omaha.
- TREND: Similar to the percentage reported in 2011 and 2015.

Note that, of those experiencing difficulty, 54.5% reported difficulty getting primary care in the past year, and 46.5% reported difficulty accessing a specialist (these categories are not mutually exclusive).

Experienced Difficulties or Delays of Some Kind in Receiving Needed Healthcare in the Past Year

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Items 171, 305-306]

Notes: Asked of all respondents.

Represented the percentage of respondents experiencing one or more barriers to accessing healthcare in the past 12 months.
• TREND: No significant change for Douglas County or Sarpy/Cass counties.

Experienced Difficulties or Delays of Some Kind in Receiving Needed Healthcare in the Past Year

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 171]
Notes: Asked of all respondents. Represents the percentage of respondents experiencing one or more barriers to accessing healthcare in the past 12 months.

Note that the following groups more often report difficulties accessing healthcare services:

• Women.
• Adults under age 65.
• Lower-income residents (negative correlation).
• Black residents.
• Other racial backgrounds.

Experienced Difficulties or Delays of Some Kind in Receiving Needed Healthcare in the Past Year (Metro Area, 2018)

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 171]
Notes: Asked of all respondents. Represents the percentage of respondents experiencing one or more barriers to accessing healthcare in the past 12 months. Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents). Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Very Low Income” includes households living with defined poverty status; “Low Income” includes households with incomes just above the FPL, earning up to twice the poverty threshold; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Barriers to Healthcare Access

Of the tested barriers, inconvenient office hours impacted the greatest share of Metro Area adults (11.9% say that inconvenient office hours prevented them from obtaining medical care in the past year), followed closely by appointment availability (11.8%).

- The proportion of impacted Metro Area adults is statistically comparable to or better than that found nationwide for each of the tested barriers.
- TREND: Over time, the proportion of adults facing barriers to healthcare access has been stable or improved for each barrier tested.

Barriers to Access Have Prevented Medical Care in the Past Year

Inconvenient Office Hours  Getting a Dr Appointment  Cost (Prescriptions)  Cost (Doctor Visit)  Finding a Doctor  Lack of Transportation  Language/Culture

Barriers to Access Have Prevented Medical Care in the Past Year (Douglas County)
TREND: In Sarpy/Cass counties, note the persistent and statistically significant increase in the barrier of trying to find a physician.

Barriers to Access Have Prevented Medical Care in the Past Year (Sarpy/Cass Counties)

As might be expected, Metro Area adults without health insurance are much more likely to report access barriers when compared to the insured population, particularly those related to cost.

Barriers to Healthcare Access (By Insured Status; Metro Area, 2018)

To better understand healthcare access barriers, survey participants were asked whether any of seven types of barriers to access prevented them from seeing a physician or obtaining a needed prescription in the past year. Again, these percentages reflect the total population, regardless of whether medical care was needed or sought.

Sources:
• PRC Community Health Surveys, Professional Research Consultants, Inc. (Items 7-13)

Notes:
• As might be expected, Metro Area adults without health insurance are much more likely to report access barriers when compared to the insured population, particularly those related to cost.
Travel Time (Sarpy, Cass, Pottawatomie Counties Only)

In the past year, 16.8% of Sarpy, Cass, and Pottawattamie County residents had to travel 30+ minutes for a medical appointment.

- The prevalence is highest among Cass County respondents.
- TREND: Statistically similar to previous findings.

Have Had to Travel 30 Minutes or More for a Medical Appointment in the Past Year
(Sarpy, Cass & Pottawattamie Counties Only)

Prescriptions

Among all Metro Area adults, 10.5% skipped or reduced medication doses in the past year in order to stretch a prescription and save money.

- More favorable than national findings.
- Similar findings by county.
  - Within Douglas County, highest in Northeast Omaha.
- TREND: Marks a statistically significant decrease from previous survey findings.
Skipped or Reduced Prescription Doses in Order to Stretch Prescriptions and Save Money

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 14]

Notes: Asked of all respondents.

- TREND: The Douglas County prevalence has decreased significantly from previous survey findings (Sarpy/Cass has been stable).

Skipped or Reduced Prescription Doses in Order to Stretch Prescriptions and Save Money

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 14]

Notes: Asked of all respondents.
Adults more likely to have skipped or reduced their prescription doses include:

- Women.
- Younger adults.
- Respondents with lower incomes (especially).
- Uninsured adults (especially).

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

Access to Care/Services
- Ease of access, medication affordability, poverty as affecting all aspects of health and health care. – Social Services Provider, Douglas County
- Location and hours of services aren’t always accessible for all. Transportation to services is limited. Providing comprehensive care within one care visit would improve access. If in for a sore throat, we should be able to receive needed service. – Other Health Provider, Douglas County
- Access and services for the poor and elderly out in the county. Difficult to get to care, financially hard. – Public Health Representative, Pottawattamie County
- We don’t have equitable access to health care for all citizens. This is a national issue. Access to health care is still largely dependent on type of job. – Business Leader, Douglas County
- Location of clinics and times open. – Community Leader, Douglas County
- Access is a very broad term. Supply side barriers, clinical hours, locations, cultural awareness of providers, related access to care have made progress, however, demand side barriers such as health literacy of patients, skills required for seeking care. – Social Services Provider, Douglas County
- Lack of access for marginalized populations. – Social Services Provider, Douglas County
- We have some incredible health care centers here in the metro, and the number of people who do not have access to health care services is declining. However, the disparities between different races, ethnicities and their access to health care. – Community Leader, Douglas County
- Lack of access means health issues are neglected or ignored. Lack of gainful employment, self-employment or employment in smaller or nontraditional fields often translates to leads to lack of, or unaffordable, health care. – Social Services Provider, Douglas County
- Proximity to services, especially emergency care. – Social Services Provider, Douglas County
- Inequity in health care access, barriers include uninsured or underinsured, areas where clinics are not located, treatment of certain patients based on their insurance status or ethnic background. Inability to serve clients in their native language. – Social Services Provider, Pottawattamie County
- Great presence in local schools. – Social Services Provider, Douglas County

Affordable Care/Services
- Having affordable healthcare for all people regardless of their incomes. There are people who have to choose between eating and buying medications. Unacceptable in this first world country. Of course people choose to eat. – Social Services Provider, Douglas County
- Affordability of services. Patients don’t have money allotted for even the least expensive community healthcare services, even $15 is too expensive for many people. – Advanced Practice Provider, Douglas County
- Cost, transportation, availability and time frame. – Social Services Provider, Douglas County
- Lack of insurance and accessibility. – Social Services Provider, Douglas County
- Poor access to affordable health insurance. We need universal health care for everyone like other progressive nations of the world provide for their citizens. Healthcare should be a right and not a privilege. – Physician, Pottawattamie County
- No affordable option for lower income families to access health care. Some sliding scale locations are still out of the price range for many. Only having one free STD clinic is not enough. Transportation is an issue with patients. – Public Health Representative, Pottawattamie County
- The number of uninsured and underinsured residents. The lack of trust in the cultural competence of the providers. Lack of transportation to health care services is also a major challenge. – Other Health Provider, Douglas County
- see previous answer – Other Health Provider, Douglas County
- Lack of affordable, coordinated and diverse care. – Other Health Provider, Douglas County
- Not all have either health coverage or adequate health coverage. Access to transportation is also a factor. Lack of knowledge of available resources. – Social Services Provider, Douglas County
- We have several clients who cannot afford medical care. We also have several clients who need mental health care and/or resources to address substance abuse. – Social Services Provider, Douglas County
- Cost of health insurance. Not just accessing for major issues for families that are eligible for Medicaid, but for
families that are deemed middle class. Small businesses struggle to offer benefits while the cost for insurance continues to rise. – Social Services Provider, Douglas County

Not enough providers and they can't pay. – Social Services Provider, Douglas County

Cost of health care. This is another national issue. The cost of health care is a major financial burden for individuals, all types of businesses, non-profits, and public sector organizations. – Business Leader, Douglas County

Affordable access to health care for all individuals in our community. – Public Health Representative, Douglas County

Transportation

Transportation. Many lower income individuals who are uninsured or underinsured. – Social Services Provider, Pottawattamie County

Transportation. Affordable options. Lack of insurance, but still not qualifying for Medicaid. Long wait lists. – Social Services Provider, Douglas County

Transportation, hours open of providers. Limited number of providers in the community. – Community Leader, Douglas County

Now that the Creighton Hospital is closed, people have to travel farther for major issues. The clinic they opened is okay, but doesn't serve all of the needs of North Omaha. Transportation to and from the major hospital systems from North Omaha is poor. – Social Services Provider, Douglas County

Farm to school, PAC programs associated with the schools, human resource groups associated with middle class working companies in town. – Community Leader, Douglas County

Transportation, cost, accessibility and operating hours. I had a child with a broken toe bone and was told bring him back at 6:00pm or go to the Emergency Room. Trying to get away from Emergency Room mentality. – Social Services Provider, Douglas County

Medicare/Medicaid Providers

Not all providers of primary care and behavioral health services accept Medicaid. Not enough mental health and substance use providers in Nebraska. Underfunding of child and adult behavioral health services. – Social Services Provider, Douglas County

Lack of Medicaid expansion. Less support for safety net providers, Community Health Centers. Transportation issues. Costs of medications for chronic disease. – Physician, Douglas County

Medicaid reimbursement cuts. Providers leaving the market, cost of the uninsured rising, fewer people with health insurance. – Community Leader, Douglas County

Awareness of Services

The answer for most of these is the same, BH must reach more groups and frankly spend more money to improve a very low public awareness of what's available. – Social Services Provider, Douglas County

Various Issues

Cultural barriers. Accessible providers near clients for people who work multiple jobs. Insurance coverage and transportation. – Community Leader, Douglas County

Health literacy, transportation, insurance, and motivation. – Social Services Provider, Douglas County

Lack of Coordinated Care

General lack of coordination between health systems that leads to over utilization and lack of prevention that could be more cost effective. The fact that healthcare is an industry here hurts us; that is a health issue. – Business Leader, Douglas County
Type of Care Most Difficult to Access

Key informants (who rated this as a “major problem”) most often identified behavioral health, substance abuse treatment, primary care, and dental care as the most difficult to access in the community.

Primary Care Services

About Primary Care

Improving health care services depends in part on ensuring that people have a usual and ongoing source of care. People with a usual source of care have better health outcomes and fewer disparities and costs. Having a primary care provider (PCP) as the usual source of care is especially important. PCPs can develop meaningful and sustained relationships with patients and provide integrated services while practicing in the context of family and community. Having a usual PCP is associated with:

- Greater patient trust in the provider
- Good patient-provider communication
- Increased likelihood that patients will receive appropriate care

Improving health care services includes increasing access to and use of evidence-based preventive services. Clinical preventive services are services that: prevent illness by detecting early warning signs or symptoms before they develop into a disease (primary prevention); or detect a disease at an earlier, and often more treatable, stage (secondary prevention).

- Healthy People 2020 (www.healthypeople.gov)

Access to Primary Care

In the Metro Area in 2014, there were 997 primary care physicians, translating to a rate of 119.5 primary care physicians per 100,000 population.

- Well above what is found statewide and nationally.
- Douglas County reports the highest rate of primary care physicians per 100,000 population, while the other counties’ rates are below state and US rates.

Access to Primary Care
(Number of Primary Care Physicians per 100,000 Population, 2014)

Sources:

Notes:
- This indicator is relevant because a shortage of health professionals contributes to access and health status issues.

- TREND: Access to primary care (in terms of the rate of primary care physicians to population) has improved over the past decade in the Metro Area.
Trends in Access to Primary Care
(Number of Primary Care Physicians per 100,000 Population)

Notes: This indicator is relevant because a shortage of health professionals contributes to access and health status issues. These figures represent all primary care physicians practicing patient care, including hospital residents. In counties with teaching hospitals, this figure may differ from the rate reported in the previous chart.

Particular Place for Medical Care
A total of 86.0% of Metro Area adults have one place where they generally go when in need of medical care.

- Above the state and US percentages.
- Viewed by county, the proportion is lowest in Douglas County.
  - Notably lower in the eastern portion of Douglas County.
- TREND: Statistically unchanged over time.

Have a Particular Place for Medical Care

Notes: Asked of all respondents.
• TREND: While statistically unchanged in Sarpy/Cass counties, the prevalence has decreased significantly in Douglas County since 2002.

**Specific Source of Ongoing Care**

In contrast to a particular place for general medical care, having a specific source of ongoing care includes having a doctor’s office, clinic, urgent care center, walk-in clinic, health center facility, hospital outpatient clinic, HMO or prepaid group, military/VA clinic, or some other kind of place to go if one is sick or needs advice about his or her health. This resource is crucial to the concept of “patient-centered medical homes” (PCMH) and does not include a hospital emergency room as a source of ongoing care.

In the Metro Area, 66.1% of survey respondents have a specific source for ongoing medical care (not shown).

- Lower than the US percentage.
- Failing to satisfy the Healthy People 2020 goal (95% or higher).
Utilization of Primary Care Services

Just over 7 in 10 Metro Area adults (71.5%) visited a physician for a routine checkup in the past year.

- Comparable to Iowa and US findings; more favorable than the Nebraska percentage.
- By county, favorably high in Sarpy County.
  - Within Douglas County, lowest in Northeast Omaha.
- TREND: Denotes a statistically significant increase from previous survey results.

Have Visited a Physician for a Checkup in the Past Year

Sources:  PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 18]
- 2017 PRC National Health Survey, Professional Research Consultants, Inc.
Notes:  Asked of all respondents.

- TREND: In Douglas County, this represents an increase since 2008, but is similar to 2002 baseline findings. Denotes a statistically significant increase over time in Sarpy/Cass counties.
- Men and adults under age 40 are less likely to have received routine care in the past year (note the positive correlation with age), as are Hispanics in the Metro Area.

Emergency Room Utilization

A total of 6.4% of Metro Area adults have gone to a hospital emergency room more than once in the past year about their own health.

- Lower than national findings.
- Similar findings by county.
  - Unfavorably high in Northeast Omaha.
- TREND: Marks a statistically significant increase from 2011 survey findings.

Have Used a Hospital Emergency Room More Than Once in the Past Year

Of those using a hospital ER, 53.7% say the visit was due to an emergency or life-threatening situation, while 34.9% indicated that the visit was during after-hours or on the weekend. A total of 3.5% cited difficulties accessing primary care for various reasons.

- TREND: Use of the ER in Douglas County and Sarpy/Cass counties remains statistically unchanged from baseline findings.
These Metro Area population segments are more likely to have used an ER for their medical care more than once in the past year:

- Adults in low-income households.
- Black residents.

### Have Used a Hospital Emergency Room More Than Once in the Past Year

**Tele-Health Visits**

Some doctor’s offices are beginning to offer tele-health visits, in which a patient uses a computer or smartphone to communicate with a physician without being face to face.

Nearly 7 in 10 survey respondents (69.1%) would be “very” or “somewhat” likely to participate in such a tele-health visit.

- Viewed by county, likelihood of participating in a tele-health visit is lowest in Pottawattamie County.
  - Within Douglas County, likelihood is highest in the western portions of Omaha and Western Douglas County.

**“Very” or “Somewhat” Likely to Participate in a Tele-Health Visit**

Oral Health

About Oral Health

Oral health is essential to overall health. Good oral health improves a person's ability to speak, smile, smell, taste, touch, chew, swallow, and make facial expressions to show feelings and emotions. However, oral diseases, from cavities to oral cancer, cause pain and disability for many Americans. Good self-care, such as brushing with fluoride toothpaste, daily flossing, and professional treatment, is key to good oral health. Health behaviors that can lead to poor oral health include: tobacco use; excessive alcohol use; and poor dietary choices.

The significant improvement in the oral health of Americans over the past 50 years is a public health success story. Most of the gains are a result of effective prevention and treatment efforts. One major success is community water fluoridation, which now benefits about 7 out of 10 Americans who get water through public water systems. However, some Americans do not have access to preventive programs. People who have the least access to preventive services and dental treatment have greater rates of oral diseases. A person's ability to access oral healthcare is associated with factors such as education level, income, race, and ethnicity.

Barriers that can limit a person's use of preventive interventions and treatments include: limited access to and availability of dental services; lack of awareness of the need for care; cost; and fear of dental procedures.

There are also social determinants that affect oral health. In general, people with lower levels of education and income, and people from specific racial/ethnic groups, have higher rates of disease. People with disabilities and other health conditions, like diabetes, are more likely to have poor oral health.

Potential strategies to address these issues include:

- Implementing and evaluating activities that have an impact on health behavior.
- Promoting interventions to reduce tooth decay, such as dental sealants and fluoride use.
- Evaluating and improving methods of monitoring oral diseases and conditions.
- Increasing the capacity of State dental health programs to provide preventive oral health services.
- Increasing the number of community health centers with an oral health component.

Healthy People 2020 (www.healthypeople.gov)

Dental Care

A total of 76.8% of Metro Area adults have visited a dentist or dental clinic (for any reason) in the past year.

- More favorable than state and US findings.
- Easily satisfies the Healthy People 2020 target (49% or higher).
- Viewed by county, the prevalence is highest in Sarpy County.
  - Considerably lower in the eastern portions of Omaha.
- TREND: Note the statistically significant increase over time.
Have Visited a Dentist or Dental Clinic Within the Past Year
Healthy People 2020 Target = 49.0% or Higher

Sources:  
• PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 20]
• 2017 PRC National Health Survey, Professional Research Consultants, Inc.
• Behavioral Risk Factor Surveillance System Survey Data. Atlanta, Georgia. United States Department of Health and Human Services, Centers for Disease Control and Prevention (CDC): 2016 Nebraska and Iowa data.

Notes:  
• Asked of all respondents.

• TREND: The Sarpy/Cass County proportion has increased significantly over time (Douglas County is similar to baseline results).

Note the following:
• Metro Area women are more likely than men to report recent dental care.
• There is a positive correlation between age and recent dental visits.
• Persons living in the higher income categories report much higher utilization of oral health services.
Whites are much more likely than Blacks or Hispanics to report recent dental care.

**Have Visited a Dentist or Dental Clinic Within the Past Year**

(Metro Area, 2018)

*Healthy People 2020 Target = 49.0% or Higher*

**Key Informant Input: Oral Health**

Key informants taking part in an online survey most often characterized *Oral Health* as a “moderate problem” in the community.

**Perceptions of Oral Health as a Problem in the Community**

(Key Informants, 2018)

- Major Problem: 21.5%
- Moderate Problem: 46.5%
- Minor Problem: 25.0%
- No Problem At All: 6.9%

**Top Concerns**

Among those rating this issue as a “major problem,” reasons related to the following:

**Affordable Care/Services**

- Lack of access to insurance or facilities. – Other Health Provider, Douglas County
- It is far too expensive. – Social Services Provider, Douglas County
- Lack of insurance, fewer dentists are taking Medicaid. – Social Services Provider, Douglas County
- Lack of resources for poverty population. – Social Services Provider, Douglas County
It is too expensive. -- Social Services Provider, Douglas County
Coverage to major dental is not sufficient for low to moderate income families. -- Community Leader, Douglas County
Lack of affordable options for dental care and dentures. -- Physician, Douglas County
Dental insurance is usually an add-on to insurance. Poverty inhibits families from seeking dental care yet oral health is connected to other health care problems long term. -- Social Services Provider, Douglas County
Access for children and adults without financial resources. -- Social Services Provider, Douglas County
High rate of children who have chronic disease who now need surgical intervention to treat. They often do not have separate insurance to have preventative care covered. If we can begin to focus on oral health prevention rather than this chronic illness. -- Public Health Representative, Douglas County
Many dentists no longer take Medicaid. -- Social Services Provider, Pottawattamie County

Contributing Factors
Drug problem in our community has likely influenced the increasing amount of young people with dental cares and disease. Many people can't afford dental insurance and will wait until their teeth are too bad to do anything about it. Lack of education. -- Public Health Representative, Pottawattamie County
Many families on well water throughout the county, fluoride treatment at an early age is lacking. It also seems that having regular checkups is a luxury rather than a necessity whereby going to the dentist becomes something you get to do. -- Business Leader, Pottawattamie County

Access to Care/Services
Not everyone has access to preventative and corrective dental care. And, they end up in the Emergency Room with pain. Some then stop eating healthy food because of bite issues. -- Social Services Provider, Douglas County
Access and affordability. -- Social Services Provider, Douglas County

Lack of Providers
Lack of dental professionals in close proximity to those in need. -- Community Leader, Douglas County
Lack of dentists in North and South Omaha, lower priority when insurance is not available and/or need to pay for basic necessities first such as rent and utilities. -- Social Services Provider, Douglas County

Health Awareness/Education
Parent education about dental care of young children but also limited access to dentists. -- Physician, Douglas County
Perceptions of Local Healthcare Services

Over 7 in 10 Metro Area adults (72.9%) rate the overall healthcare services available in their community as “excellent” or “very good.”

- Another 20.6% gave “good” ratings.

![Rating of Overall Healthcare Services Available in the Community](image)

**Rating of Overall Healthcare Services Available in the Community**
*(Metro Area, 2018)*

- Excellent: 34.8%
- Very Good: 38.1%
- Good: 20.6%
- Fair: 4.0%
- Poor: 2.7%

Sources: 2018 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 6]
Notes: Asked of all respondents.

However, 6.7% of residents characterize local healthcare services as “fair” or “poor.”

- Well below that reported nationally.
- By county, the prevalence is highest in Douglas County.
  - Low ratings are more prevalent in the eastern portions of Omaha.
- TREND: Marks a statistically significant improvement in ratings.
Perceive Local Healthcare Services as “Fair/Poor”

**Metro Area**

- **TREND:** Marks a statistically significant improvement in ratings for Douglas County as well as Sarpy/Cass counties.

Perceive Local Healthcare Services as “Fair/Poor”

**Douglas County**

- 2002: 12.1%
- 2008: 11.7%
- 2011: 9.7%

Participation in Health Promotion Events

**About Educational & Community-Based Programs**

Educational and community-based programs play a key role in preventing disease and injury, improving health, and enhancing quality of life.

Health status and related-health behaviors are determined by influences at multiple levels: personal, organizational/institutional, environmental, and policy. Because significant and dynamic interrelationships exist among these different levels of health determinants, educational and community-based programs are most likely to succeed in improving health and wellness when they address influences at all levels and in a variety of environments/settings.

Education and community-based programs and strategies are designed to reach people outside of traditional healthcare settings. These settings may include schools, worksites, healthcare facilities, and/or communities.

Using nontraditional settings can help encourage informal information sharing within communities through peer social interaction. Reaching out to people in different settings also allows for greater tailoring of health information and education.

Educational and community-based programs encourage and enhance health and wellness by educating communities on topics such as: chronic diseases; injury and violence prevention; mental illness/behavioral health; unintended pregnancy; oral health; tobacco use; substance abuse; nutrition; and obesity prevention.

- Healthy People 2020 (www.healthypeople.gov)

A total of 27.6% of Metro Area adults participated in some type of organized health promotion activity in the past year, such as health fairs, health screenings, or seminars.

- Similar findings by county.
  - Within Douglas County, attendance is lowest in the eastern portions of Omaha.
- TREND: Marks a statistically significant increase in attendance over time.

Notes: Asked of all respondents.
**Participated in a Health Promotion Activity in the Past Year**

- **TREND:** Marks a statistically significant increase in attendance over time for Sarpy/Cass counties (statistically unchanged over time for Douglas County).

These population segments are less likely to report participation in a health promotion activity within the past year:

- Men.
- Young adults and seniors.
- Those in low-income households.
- Hispanics.
- The uninsured.

**Participated in a Health Promotion Activity in the Past Year**
(Metro Area, 2018)
Healthcare Resources & Facilities

Hospitals & Federally Qualified Health Centers (FQHCs)

The following map details the hospitals and Federally Qualified Health Centers (FQHCs) within the Metro Area as of December 2016.
Resources Available to Address the Significant Health Needs

The following represent potential measures and resources (such as programs, organizations, and facilities in the community) identified by key informants as available to address the significant health needs identified in this report. This list only reflects input from participants in the Online Key Informant Survey and should not be considered to be exhaustive nor an all-inclusive list of available resources.

Access to Healthcare Services

- Access to Medical Care
- All Care Health Center

**Appendix A: Douglas County Trend Summary**

The following tables outline current findings, comparisons to benchmark data, and trends specific to Douglas County. Note that, for survey data, trending is compared against baseline data, the earliest year in which a question was asked (in most cases, 2002).

<table>
<thead>
<tr>
<th>Social Determinants</th>
<th>Douglas County vs. Benchmarks</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Douglas County</td>
</tr>
<tr>
<td>% &quot;Often/Sometimes&quot; Worry That Food Will Run Out</td>

## Appendix B: Sarpy/Cass Counties Trend Summary

The following tables outline current findings, comparisons to benchmark data, and trends specific to Sarpy and Cass counties combined. Note that, for survey data, trending is compared against baseline data, the earliest year in which a question was asked (for Sarpy/Cass counties, in most cases, 2008).
